RE: Consent Decree (Case: No. 1:12-cv-24400-FAM)
Reference DOJ Case No. 90-5-1-1-4022/1
Section VI – Pump Station Operations and Preventative Maintenance Program (PSOPMP), Paragraph 19(f)

Dear Sir/Madam:

The Miami-Dade County (County) is in receipt of the United States Environmental Protection Agency (EPA) and Florida Department of Environmental Protection (FDEP) approval of the Pump Station Operations and Preventative Maintenance Program (PSOPMP) and herein submit a copy of the final document.

The County remains committed to successfully meeting the requirements of the Consent Decree.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or

persons who manage the system, or those persons directly responsible for gathering such information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Should you have any questions regarding this matter, please call me at (786) 552-8571.

Sincerely,

Hardeep Anand

00.02 Glossary

Building Backup: A wastewater release or backup into a building or private property that is caused by blockages, flow conditions, or other malfunctions in Miami-Dade's wastewater collection and transmission system (WCTS). A wastewater backup or release that is caused by blockages, flow conditions, or other malfunctions of a Private Lateral or internal building plumbing is not a Building Backup.

Capacity, Management, Operations, and Maintenance (CMOM): A program of accepted industry practices to properly manage, operate, and maintain sanitary wastewater collection, transmission, and treatment systems, investigate capacity constrained areas of these systems, and respond to sanitary sewer overflow (SSO) events.

Closed-circuit Television (CCTV): Technology by which Miami-Dade inspection crews and/or its outside contractors use a video camera to visually inspect the internal condition of pipes and sub-surface structures.

Consent Decree (CD): The Consent Decree, Case: 1:12-cv-24400-FAM, negotiated between Miami-Dade County, Florida (Defendant), the Florida Department of Environmental Protection and the U.S. Environmental Protection Agency (Plaintiffs).

Consent Decree Program Management and Construction Management Team (CD PMCM): The professional services consulting team competitively selected by the County to support MDWASD in the implementation of the requirements of the CD.

Environmental Protection Agency (EPA): United States Environmental Protection Agency and any of its successor departments or agencies.

Fats, Oils, and Grease (FOG) Control Program: "FOG" refers to fats, oils, and grease, which are generated by residents and businesses processing or serving food and other products. A FOG Control program aims to prevent FOG accumulation in sewer systems.

Force Mains: Any pipe that receives and conveys, under pressure, wastewater from the discharge side of a pump. A force main is intended to convey wastewater under pressure.

Geographic Information System (GIS): A system consisting of hardware, software, and data that is designed to capture, store, and analyze geographically-referenced information.

Gravity Sewer Line or Gravity Sewer: Pipes that receive, contain, and convey wastewater not normally under pressure, but are intended to flow unassisted under the influence of gravity.

Gravity Sewer System Operations and Maintenance Program (GSSOMP): The Consent Decree stipulated CMOM deliverable that sets forth the protocols and procedures associated with the operations and maintenance gravity sewer system.

Infiltration: As defined by 40 CFR § 35.2005(b)(20) shall mean water other than wastewater that enters the WCTS (including sewer service connections and foundation drains) from the ground through such means as defective pipe, pipe joints, connections, or manholes.

Inflow: As defined by 40 CFR § 35.2005(b)(21) shall mean water other than wastewater that enters the WCTS (including sewer service connections) from sources such as, but not limited to, roof leaders, cellar drains, yard drains, area drains, drains from springs and swampy areas, manhole covers, cross connections between storm sewers and sanitary sewers, catch basins, cooling towers, storm water, surface runoff, street wash waters, or drainage.

Infiltration and Inflow (I/I): The total quantity of water from inflow, infiltration, and rainfall-induced infiltration and inflow without distinguishing the source.

Lift Station: A facility in the WCTS comprised of pumps which lift wastewater to a higher hydraulic elevation, including related electrical, mechanical, and structural systems necessary to the operation of the lift station (referenced in this document as pump station). As defined in MDWASD's 1996 O&M Manual, lift stations discharge to a downstream gravity main.

Manhole or Junction Box: Part of the gravity sewer system. A structure which provides a connection point for gravity lines, private service laterals, or force mains, as well as an access point for maintenance and repair activities.

Master Pump Station: A Master Pump Station is a type A wet well / dry well pump station with a building housing five or more large pumps (greater than 25 brake horsepower (BHP) each). Master Pump Stations pump into large force mains that feed directly to a treatment plant.

Miami-Dade: Miami-Dade County, Florida, including all of its departments, agencies, instrumentalities such as the Water and Sewer Department and the Department of Regulatory and Economic Resources, and any successors thereto.

NPDES: The National Pollutant Discharge Elimination System (NPDES) authorized under Section 403 of the Clean Water Act (CWA).

Nominal Average Pump Operating Time (NAPOT): The criteria from the First Partial Consent Decree and the Second and Final Partial Consent Decree requiring that each pump station operate at a nominal average pump operating time of less than or equal to 10 hours per day with exceedances of the criteria requiring a Remedial Action Plan and no building permits issued for connection to the WCTS upstream of that station.

Private Lateral: The portion of a sanitary sewer conveyance pipe that extends from a single-family, multifamily, apartment or other dwelling unit, or commercial or industrial structure to which wastewater service is or has been provided up to the property line of such structure or to a public sewer in a proper easement.

Prohibited Bypass: The intentional diversion of waste streams from any portion of a treatment facility which is prohibited pursuant to the terms set forth at 40 CFR § 122.41(m).

Public Document Repository (PDR): The Miami-Dade Water and Sewer Department (MDWASD) located at 3071 SW 38th Ave and the Miami-Dade Water and Sewer Department's website, http://www.miamidade.gov/water.

Public Lateral: The portion of a sanitary sewer conveyance pipe that extends from the private lateral, which typically has a cleanout located at the property line or at the easement line, to the sewer main.

Pump Station: A facility in the WCTS comprised of pumps which transport wastewater from one location to another location, and which includes related electrical, mechanical, and structural systems necessary for the operation of the pump station. As defined in MDWASD's 1996 O&M Manual, pump stations discharge to a force main, to a booster station, or to a WWTP.

Pump Station Operations and Preventative Maintenance Program (PSOPMP): The Consent Decree stipulated CMOM deliverable that sets forth the protocols and procedures associated with the operations and maintenance of the pump station sewer system.

Sanitary Sewer Overflow (SSO): Any discharge of wastewater to waters of the United States or the State from Miami-Dade's WCTC through a point source not permitted in any NPDES permit, as well as any overflow, spill, or release of wastewater to public or private property from the WCTS that may or may not have reached waters of the United States or the State, including building backups. A wastewater overflow, backup, or release that is caused by blockages, flow conditions, or other malfunctions of a Private Lateral or internal building plumbing is not a SSO.

Sewer Overflow Response Plan (SORP): The SORP provides structured guidance, including a range of field activities to choose from, for a generalized uniform response to overflows, backup, or releases.

Supervisory Control and Data Acquisition (SCADA) System: A system of automated sensory control equipment that monitors the operation of lift stations (or pump stations) within the wastewater collection and transmission system (WCTS). The SCADA system is designed to convey alarms when predetermined conditions occur, to monitor pump stations operating parameters and to remotely operate pumps. Monitoring parameters may include, but are not limited to, power failures, high wet well levels, pump failures that could potentially cause

overflows, excessive pump runtimes, or other alarm set points as may be determined by system operators.

Wastewater System: The Wastewater Collection and Transmission System (WCTS) and the Wastewater Treatment Plants (WWTPs).

Wastewater Collection and Transmission System (WCTS): The municipal wastewater collection and transmission system, including all pipes, force mains, gravity sewer lines, pump stations, manholes, and appurtenances thereto, which are owned or operated by the Miami-Dade designed to collect and convey municipal sewage (domestic, commercial, and industrial to Miami-Dade's WWTPs.

Wastewater Treatment Plant (WWTP): Devices or systems used in the storage, treatment, recycling, and reclamation of municipal wastewater and include all facilities owned, managed, operated, and maintained by Miami-Dade, including but not limited to the North District WWTP, the Central District WWTP, and the South District WWTP, and all components of those plants.

THIS PAGE LEFT INTENTIONALLY BLANK

01. Introduction

The Miami-Dade Water and Sewer Department (MDWASD) prepared this Pump Station Operations and Preventative Maintenance Program (PSOPMP) plan in compliance with Section 19(f) of the Consent Decree (CD) between Miami-Dade County (County) and the plaintiffs, the United States of America, the State of Florida (State), and the Florida Department of Environmental Protection (FDEP), adjudicated by the United States District Court for the Southern District of Florida in Case No. 1:12-cv-24400-FAM. The CD requires the County to develop, submit, finalize, and implement plans for the continued improvement of its wastewater collection and transmission system (WCTS) and wastewater treatment plants (WWTPs) to eliminate, reduce, prevent, or otherwise control sanitary sewer overflows (SSOs); to correct effluent limit violations; and to properly manage, operate, and maintain its WCTS and WWTPs.

01.01 Summary of the Pump Station System

As of February 1, 2015, MDWASD's pump station system consists of 1,028 MDWASD-owned pump stations, and an additional 19 pump stations maintained under maintenance agreements with other agencies and departments. In addition, there are numerous private pump stations discharging wastewater into MDWASD's WCTS. The number of stations is subject to change due to additions and abandonments in a dynamic, urban service area such as Miami-Dade County.

The Pump Station Division (PSD) is responsible for the operation and maintenance (O&M) of the MDWASD stations and the stations under maintenance agreements, except for the two master pump stations, PS 0001 (a.k.a., Fourth Street) and PS 0002 (a.k.a., Ninth Street), that are WWTP influent pump stations operated and maintained by the Wastewater Treatment and Maintenance Division. The MDWASD pump station system has different types and sizes of pump stations ranging from smaller lift stations designed to handle individual flows from commercial establishments, to master stations that receive flows from a large service area and which pump directly to the treatment plant. For consistency with the CD, this document will refer to both types of stations as pump stations.

01.01.1 Pump Station Service Areas

The MDWASD treatment plant service area is divided into the North, Central, and South Districts, each served by separate wastewater treatment facilities. The PSD further divides the Central District into the Central West and the Central East Service Areas for operational and maintenance purposes. The WCTS covers approximately 443 square miles of area and, as of February 1, 2015, included approximately 6,300 miles of pipelines. The MDWASD system also receives flow from fifteen wholesale municipal customers, known locally as volume sewer customers.

01.01.2 Pump Station Flow Schematics

The pump station system includes booster stations, regional stations, and master stations (master stations are regional stations that pump directly into Central District WWTP). The centrally located Pump Station 187 (33-P1) is utilized to distribute flows between the three treatment plant service areas. Pump Station 187 has the ability to divert flow from any of the three districts to another district or to the other two districts. Pump Station 187 also has the ability to divert flow from any two districts and send their flow to the other district. SCADA controls are installed to allow PSD personnel to remotely monitor and operate the station. Diversion of flows requires manual operation of station and transmission valves. Appendix A, Pump Station Route Flow Schematics, contains flow schematics illustrating the flow path for each pump station within the various treatment plant service areas. The two Central District plant influent pump stations, Master Pump Stations 0001 and 0002, which are operated and maintained by the Wastewater Treatment and Maintenance Division, will be addressed as part of the WWTP Operations and Maintenance Program, which is a separate CMOM Program document from this PSOPMP document.

Figure 01.1 on the following page shows the maintenance service area boundaries for Miami-Dade County.

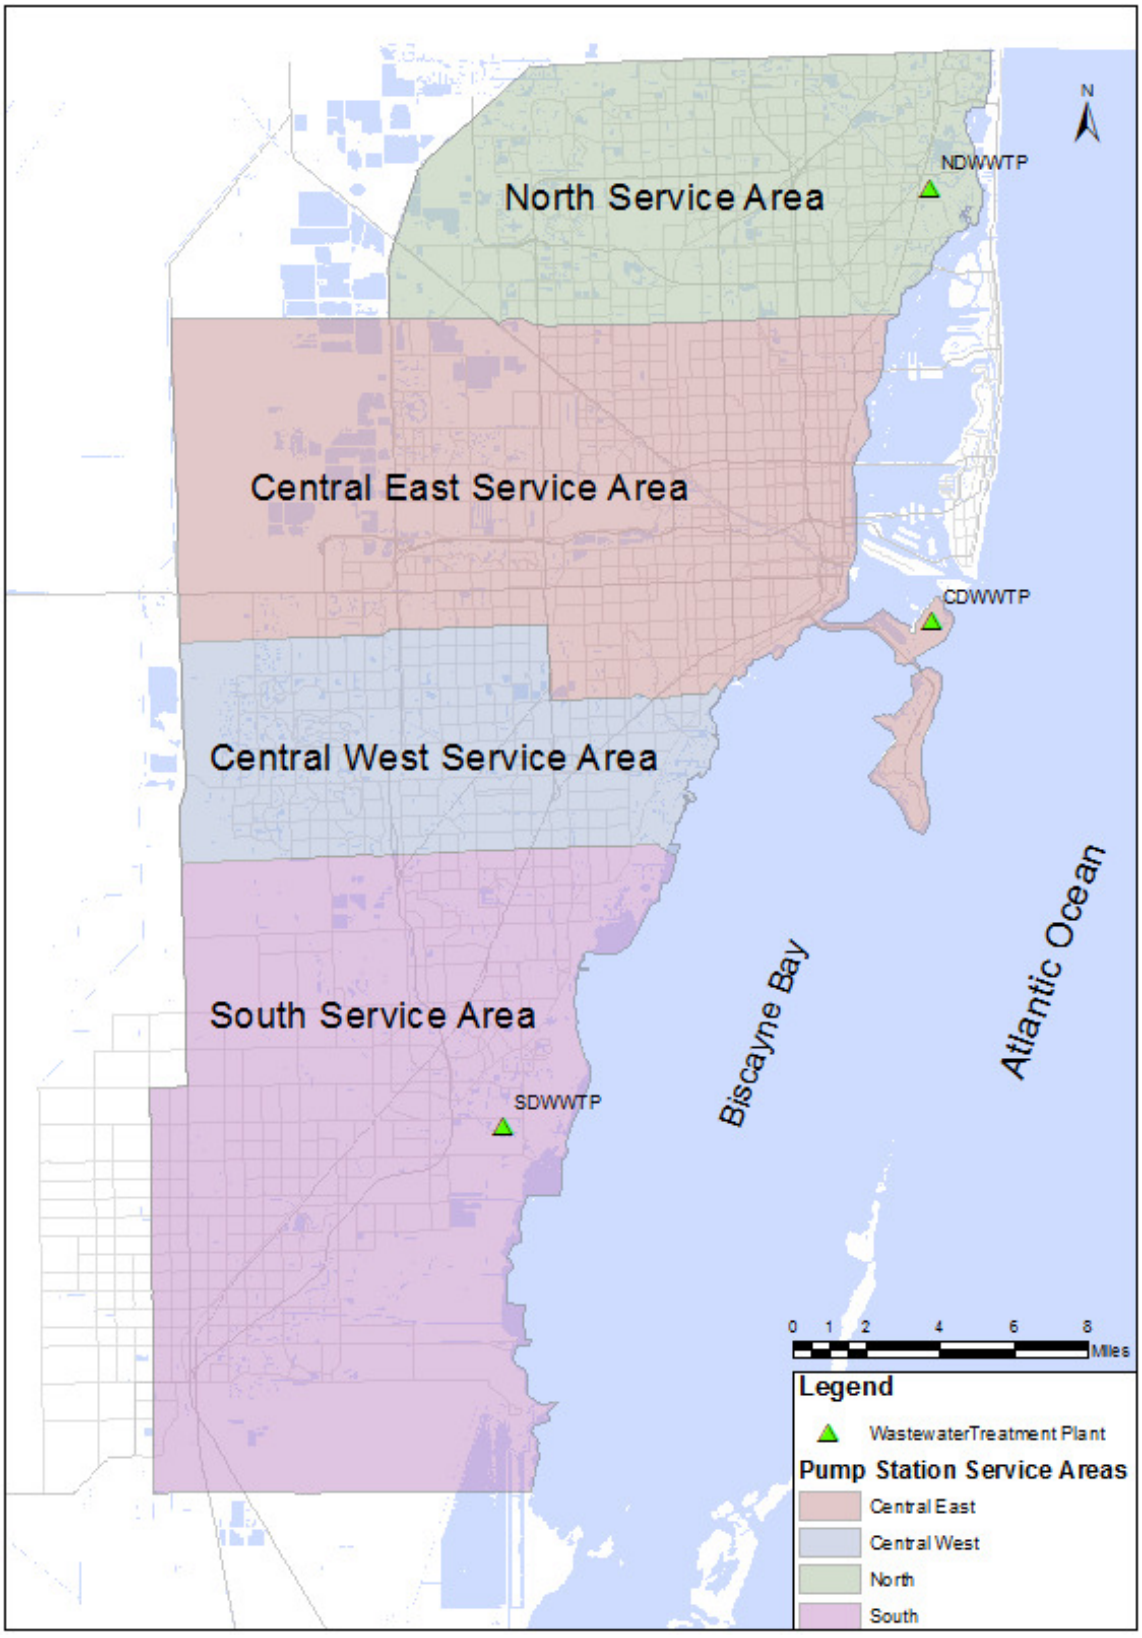

Figure 01.1
MDWASD Pump Station Maintenance Service Areas

01.02 Regulatory Drivers

Compliance with the requirements of the Clean Water Act (CWA) is the primary regulatory driver for the PSOPMP. The County negotiated the terms of the CD with EPA and FDEP in response to violations of the CWA, which consisted of unpermitted discharges of untreated sanitary sewage into waters of the United States from the WCTS and which are referred to as sanitary sewer overflows or SSOs.

To support realization of the goal of reducing, preventing, or otherwise controlling SSOs and prohibited discharges to waters of the United States, the CD, Section 18, requires MDWASD to continue programs initiated under previous CDs, and Section 19 stipulates the development of CMOM[1] programs across all areas of the wastewater, collection, transmission, and treatment systems, including: pump stations, force mains, gravity sewers, and wastewater treatment plants. CD Section 18 "existing" CMOM programs and Section 19 "new" CMOM programs are listed below. The CD Programs listed in ***bold italics*** have direct impact on elements and requirements of the PSOPMP.

1. ***18(a) Adequate Pumping, Transmission, and Treatment Capacity (APTTC) Program;***
2. ***18(b) Pump Station Remote Monitoring (PSRM) Program;***
3. ***18(c) WCTS Model;***
4. ***18(d) Spare Parts Program (SPP);***
5. *18(e) Volume Sewer Customer Ordinance (VSCO) Program;*
6. *19(a) Fats, Oils, and Grease (FOG) Control Program;*
7. ***19(b) Sewer Overflow Response Plan (SORP);***
8. ***19(c) Information Management System (IMS) Program;***
9. ***19(d) Sewer System Asset Management Program (SSAMP);***
10. ***19(e) Gravity Sewer System Operations and Maintenance Program (GSSOMP);***

[1] The MDWASD wastewater system has not experienced a capacity related SSO since 2002, and accordingly, the CD focuses on Management, Operations, and Maintenance, or MOM, related programs, but uses the familiar acronym of CMOM throughout the document.

11. ***19(f) Pump Station Operations and Preventative Maintenance Program (PSOPMP);***
12. **19(g)** ***Force Main Operations, Preventative Maintenance, and Assessment / Rehabilitation Program*;**
13. *19(h) WWTP Operations and Maintenance Program;*
14. ***19(i) Specific Capital Improvements Projects**; and*
15. *19(j) Financial Analysis Program.*

The sub-paragraphs of 19(f) require specific actions to develop a preventative CMOM program plan for the pump station system. The PSOPMP must include the following:

- Identification of the means and modes of communication between pump stations, field crews, and supervising staff;
- Technical specifications of each pump station within the WCTS;
- Description of each pump station monitoring system;
- Written preventative operation and maintenance (O&M) schedules and procedures;
- Written standard emergency / reactive O&M procedures;
- An inventory management system, including critical equipment and critical spare parts;
- Reports listing equipment problems and the status of work orders generated during the prior month; and
- A staffing and funding plan with structure, skills, numbers, and funding to allow completion of the O&M activities required by the PSOPMP.

In addition to the specific requirements of Section 19, the CD references specific guidance tools that support the incorporation of industry CMOM “best-practices” in municipal wastewater utility operations. Industry CMOM best-practices are those core WCTS management attributes commonly found in highly performing utilities and often include adoption of asset and life-cycle-cost management concepts through implementation of preventative and predictive management policies and procedures. Reductions in emergency maintenance and repair activities leading to reductions in SSOs demonstrate the effectiveness of these best-practices. The CD requires concurrent development and implementation of the fifteen separate management programs

listed above. The programs' inherent interdependencies require an interdisciplinary and integrated approach to wastewater system management, operations, and management.

01.03 Miami-Dade County Organization

The County operates under Home-Rule Authority granted by the Florida State Constitution. The unincorporated areas of Miami-Dade County are governed by the 13 member Board of County Commissioners (Commission). The County government provides major metropolitan services countywide and city-type services for residents of the unincorporated areas. Miami-Dade County has a Mayor who oversees the day-to-day operations of the County. The County is organized into 25 Departments, each led by a Mayor-appointed Director.

01.03.1 Water and Sewer Department Organization

As shown in Figure 01.2, two Deputy Directors manage the MDWASD under the authority of the Director: the Deputy Director of Operations and the Deputy Director of Regulatory Compliance and Capital Improvements. There are four Assistant Directors under the Deputy Director of Operations, and two Assistant Directors and a Chief of Priority Capital Projects under the Deputy of Regulatory Compliance and Capital Improvements. As discussed in Subsection 01.03.2 below, the pump stations are under the Assistant Director for Wastewater System Operations.

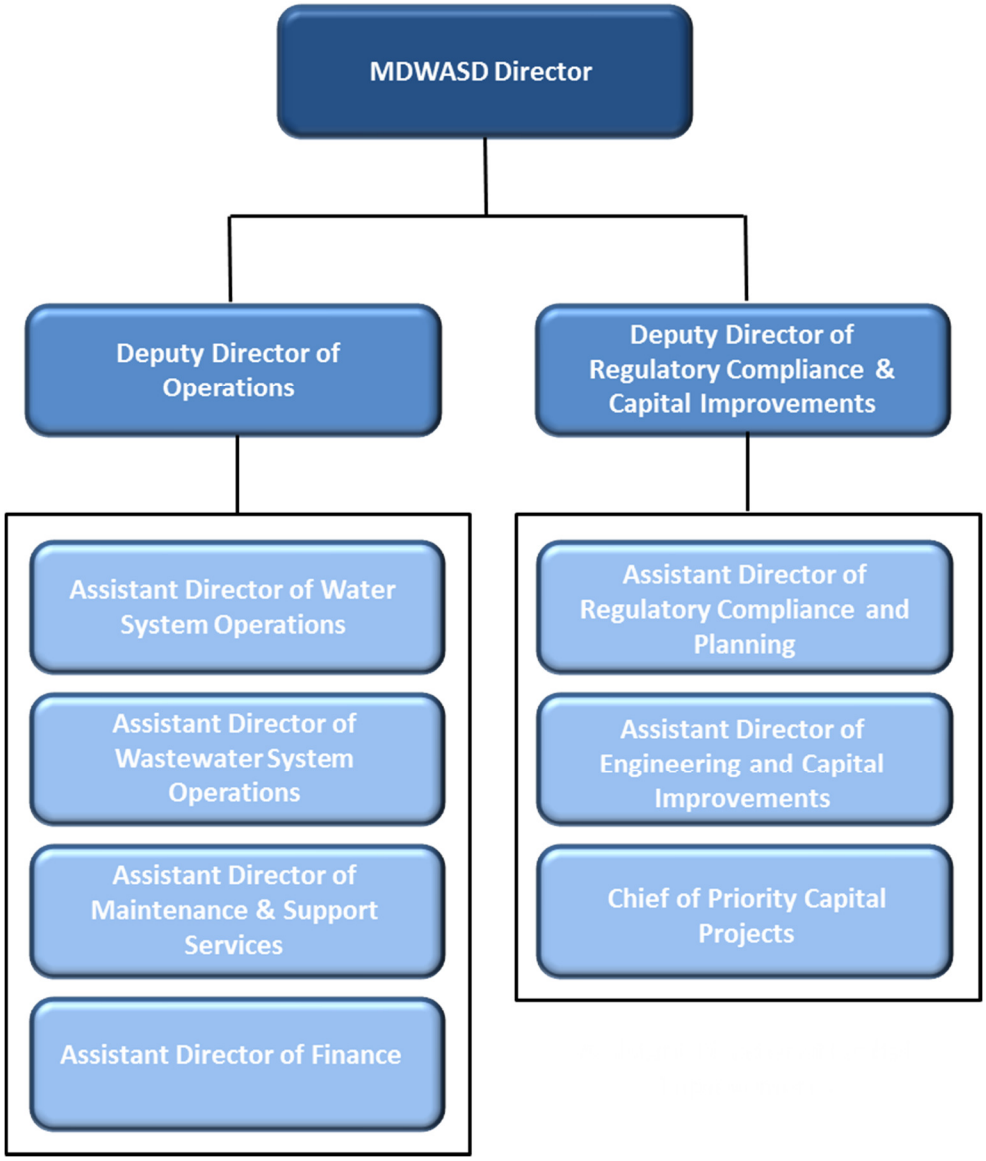

Figure 01.2
MDWASD Organization Chart

The MDWASD operates as an enterprise fund. Thus, the sale of bonds, grant awards, user and permitting fees, and water and sewer rates provide the revenue to fund its staff of nearly 2,500 and its $465 million annual budget in Fiscal Year (FY) 2014-2015, the last budget year with an approved budget at the time of writing of this PSOPMP. The MDWASD fiscal year is from October 1 through September 30. As of the writing of this document, the proposed budget for FY 2015-2016 has already been submitted.

01.03.2 Pump Station Division Organization

The Pump Station Division (PSD) Chief reports to the Assistant Director of Wastewater System Operations, as shown in Figure 01.3. The PSD Chief has five functional sections, as described following Figure 01.3.

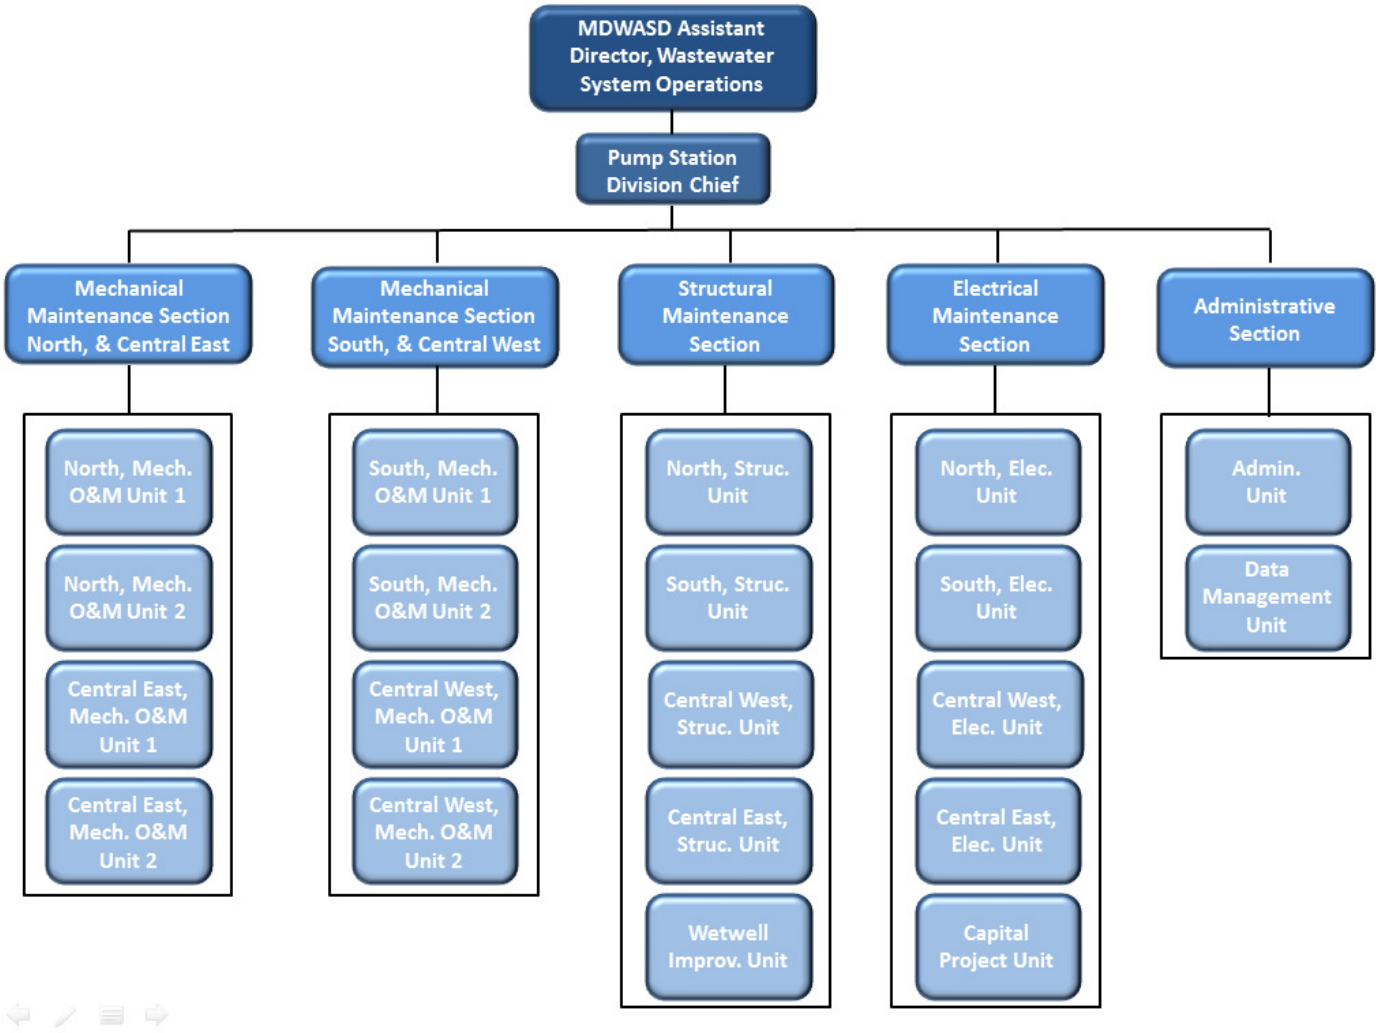

Figure 01.3
Pump Station Division Organization Chart

Mechanical Maintenance Section: The Mechanical Maintenance Section is subdivided into two sections based on geography: the North & Central East Section and the South & Central West Section. These sections are responsible for mechanical equipment.

Structural Maintenance Section: The Structural Maintenance Section is responsible for the pump station structures, including buildings, foundations, wet wells, gratings, grounds, etc.

Electrical Maintenance Section: The Electrical Maintenance Section is responsible for electrical and controls equipment.

Administrative Section: The Administrative Section provides administrative and accounting support to the other sections and directly to the Division staff.

In addition to the four Sections under the PSD Chief, the PSD obtains assistance from other groups within MDWASD. The key functional assistance areas are listed, and briefly described, below. More detailed descriptions are included in subsequent sections of this plan document as appropriate.

- Wastewater Collection and Transmission Line Division, which is responsible for the gravity sewer system and the force mains. This group will respond to pump station-related spills when the spill occurs at a manhole upstream of the pump station or in a force main downstream of the pump station.
- Emergency Communications Center, which is responsible for receiving “problem calls” and monitoring Supervisory Control and Data Acquisition System (SCADA) alarms for the pump stations.
- SCADA Section, which is responsible for implementation and maintenance of the supervisory control and data acquisition system, network, and infrastructure for all MDWASD’s pump stations and treatment facilities. Responsibility includes instrumentation and electronic equipment maintenance for the Pump Station Division.
- Meter Installation and Maintenance Section, which is responsible for meter installation and maintenance, including the pump station meters as well as the various volume sewer customer meters and other MDWASD system meters.
- General Maintenance Division, which is responsible for the grounds, fleet, and heating, ventilation, and air conditioning (HVAC) maintenance.

- Stores and Procurement Division, which is responsible for parts inventory, storage, and purchasing.

01.04 PSOPMP Overview

The considerations necessary for the development of PSOPMP include the regulatory drivers listed in the previous sub-sections, industry "best-practices" in pump station system O&M, the other existing and new CMOM Programs, and the local business needs of MDWASD. The designed interdependencies between regulatory requirements and the other CMOM Programs necessitate a phased implementation and adoption of a continuous improvement process. The resultant PSOPMP, the phased implementation, and the continuous improvement processes are detailed in subsequent sections of this document.

Industry best-practices used by MDWASD and the PSD include that of various professional organizations, CMOM publications, and national standard organizations for mechanical, electrical, and structural codes. Examples of such guidance documents used to develop the PSOPMP include, but are not limited to, *Occupational, Safety and Health Administration (OSHA), Core Attributes of Effectively Managed Wastewater Collection Systems, Effective Utility Management: A Primer for Water and Wastewater Utilities, Guide for Evaluating Capacity, Management, Operation, and Maintenance (CMOM) Programs at Sanitary Sewer Collection Systems, Optimization of Collection System Maintenance Frequencies and System Performance, Optimizing Operation, Maintenance, and Rehabilitation of Sanitary Sewer Collection Systems, Protocols for identifying Sanitary Sewer Overflows, Sanitary Sewer Overflow Solutions, National Electric Code, National Electrical Manufacturers Association (NEMA) standards and specifications, Electrical Safety Orders, General Industry Safety Orders, Uniform Building Code, and National Fire Protection Code.*

01.05 PSOPMP Document Organization

This PSOPMP plan document is organized to meet both the requirements of the CD as well as the business needs of the PSD. The PSOPMP plan organization is listed in Table 01.1. Where applicable, the corresponding CD section reference is listed adjacent to the section or subsection name and the associated document page number.

02. PSOPMP Purpose and Goals

In accordance with the CD requirement to establish a written, defined purpose and written, defined goals, Section 02.01 provides the PSOPMP purpose and Section 02.02 provides the PSOPMP goals.

02.01 PSOPMP Purpose

The purpose of the PSOPMP is to establish and document processes and procedures to operate and maintain MDWASD's pump stations, and the pump stations under maintenance agreements with MDWASD, in a manner that ensures the pump stations:

- Operate as designed by trained, well-qualified staff,
- Provide uninterrupted service to customers,
- Extend the useful life of pump station assets, and
- Optimize operational and capital replacement expenditures to maintain affordable customer rates.

02.02 PSOPMP Goals

The PSOPMP goals are to:

- Operate and maintain the pump stations with minimal service interruptions,
- Perform preventative and predictive maintenance in a manner that minimizes the potential for structural, mechanical, electrical, instrumentation, or hydraulic failures that could result in SSO events,
- Ensure pump station-related malfunctions or failures are corrected in a timely, efficient, and effective manner, and
- Maximize the level of customer service, regulatory compliance, and the effective use of resources for pump station-related activities.

This document contains the initial phase of the PSOPMP plan and a schedule of specific recommendations intended to transition this program into subsequent phases.

THIS PAGE LEFT INTENTIONALLY BLANK

03. Phased PSOPMP Plan Development

PSOPMP development and implementation will be phased to ensure cohesiveness and proper integration of the PSOPMP with other CD-required CMOM Programs currently under development. The PSOPMP relies upon the management and implementation efficiency gained through incorporation of specific knowledge area policies, procedures, activities, technologies, and tools inherent to other CMOM Programs. Portions of the PSOPMP that are consistent with existing pump station O&M activities will be implemented immediately. Portions of the recommended PSOPMP activities that will require additional field investigations to fully populate databases, such as the Technical Specifications database, will be part of the phased implementation process. The phased implementation is summarized in Section 03.02, Planned Support Activities, below, as well as noted in the applicable detailed section of this plan document devoted to that particular implementation activity.

03.01 PSOPMP Plan Review and Revision

In accordance with the CMOM philosophy of continuous improvement, the PSD developed internal performance measures as described in Section 04, PSOPMP Performance Measures, to evaluate PSOPMP progress toward established goals. Monthly performance measure reports will be generated and evaluated on a semi-annual and annual basis.

The defined performance measures may be modified to better suit the business needs of the County. Material changes to the PSOPMP will be submitted to the EPA/FDEP for review and approval and documented in the Annual Report submitted to EPA/FDEP as part of CD reporting compliance.

During the annual review, the monthly reports and the semi-annual evaluation will be reviewed, and lessons learned will be noted to enable MDWASD to continuously improve the PSOPMP and other affected programs. The annual review will also include a review of the effect of other CMOM Programs, changing conditions, revisions to regulatory requirements, and other factors that may impact the pump station system. As the PSOPMP matures, less frequent evaluations may be recommended. The results will continue to be documented in the Annual Report to EPA/FDEP as part of CD reporting compliance.

03.02 Planned Supportive Actions

As noted above, the proposed PSOPMP depends on other yet-to-be-developed and implemented new CMOM Programs. The disparity between the required EPA/FDEP submittal dates for these CMOM Programs not only demonstrates a need for a phased implementation approach, but the need to consolidate new CMOM Program implementation schedules. Upon EPA/FDEP approval of other CMOM Program plan documents, MDWASD will submit a proposed consolidated implementation plan and schedule to include CMOM Programs. This will facilitate the task of tracking implementation for CMOM programs, individual CMOM elements, required resources, and schedules.

Implementation of the PSOPMP is contingent upon distinct CD controlled and non-CD controlled predecessors. These include, but are not limited to:

- Submittal, and subsequent EPA/FDEP approval, of the IMS, the SORP, and the Sewer System Asset Management CMOM Programs;
- Completion of, or updates to, existing CMOM Programs, i.e., Adequate Pumping, Transmission and Treatment Capacity, Pump Station Remote Monitoring (SCADA), the WCTS Model, Spare Parts, and the Volume Sewer Customer Ordinance Programs;
- Completion of the Miami-Dade GIS Updates and addition of accurate manhole rim and invert elevations upstream of pump stations;
- Implementation of the IMS and the SSAMP CMOM Programs; and
- Allocation and acquisition of PSOPMP staffing and funding resources to augment the PSD's existing resources to expand its preventative and predictive maintenance activities.

03.02.1 Phased Implementation Actions

The proposed staffing and associated funding for the phased implementation of the PSOPMP is detailed in Section 09, Staffing and Funding Plan, Table 03.1 on the following page summarizes the key implementation activities. Implementation of these activities will require additional staff and equipment as detailed in Table 09.2 in Section 09 as well as the consultant/vendor resources.

03.02.2 Implementation Schedule

The PSOPMP will be implemented in phases. Portions of the PSOPMP will be implemented immediately. The immediate implementation items include the routine and preventative maintenance activities that are currently being performed. Upon EPA/FDEP approval of this PSOPMP and the other CMOM Program documents for which PSOPMP dependencies exist, the activities listed in Table 03.1 will be implemented.

A consolidated implementation schedule will be developed as part of the Information Management System (IMS) Program. The IMS Program is required to be submitted by December 6, 2015.

Table 03.1
Proposed PSOPMP Phased Implementation Activities

Activity	Abbreviated Description
Wet Well Cleaning	Add PSD wet well crews to conduct routine inspections of wet well conditions, observe and document inspections, and subsequently perform wet well cleaning on an as needed basis to combat increasing clogging problems due to "non-flushable" materials, debris deposition, and grease buildup.
PS Technical Specifications Data Attribution	Add PSD staff to manage various consultant resources to conduct field site inspections of existing pump stations and to input resulting data into the EAMS database. This task is designed to ensure asset data fields in EAMS are populated with accurate asset data. This task also includes procurement of consultant or vendor resources as well as determining the best database repository for pump station asset positions, which currently reside within EAMS.
Critical Spare Parts	Subsequent to the completion of the Pump Station Technical Specifications Data Attribution, the asset inventory will be used to update and refine the spare parts (e.g., "insurance items") list.
Diesel Equipment Maintenance	Add Mechanical trade staff for PSD to accomplish pump station emergency generator and portable pump diesel equipment maintenance (i.e., mobile and fixed) currently performed by Fleet Maintenance and Wastewater Plant Maintenance Divisions.
PS Operations & Instrumentation	Move SCADA alarm monitoring function to the PSD and add required shifts to ensure 24/7 monitoring. Add both PS Operations staff and Instrumentation Technician staff to maintain instrumentation located in the pump stations.
Maintenance Scheduling	Establish and provide oversight and development of maintenance scheduling for routine, preventative, and predictive maintenance in EAMS. Oversee the EAMS software for PSD. Work with in-house engineer to manage and maintain accurate database of assets in EAMS.
Submersible Repair Shop	Add PSD Mechanical trade staff to repair submersible pumps and PS Supervisor staff to adequately manage the current submersible pump repair shops. Due to the high number of submersible pumps utilized by the PSD, a 2nd submersible pump repair shop is required.
Mechanical Capital Improvement	Perform mechanical capital projects. Provide support to O&M staff and manage capital improvements to mechanical equipment.
Predictive Maintenance	Addition of new PSD staff to accomplish Predictive Maintenance activities, including vibration analysis, thermal imaging, insulation resistance, and oil analysis, which are used to find defects not typically discovered during routine or preventative maintenance inspections.
Analyze Communications	Analyze communications options, such as radio, cellular, beeper, etc., to determine best means of communications between field personnel and supervisors.

04. PSOPMP Performance Measures

In accordance with the CD requirement that MDWASD establish performance measures and develop written procedures for periodic review, Section 04.01 establishes the purpose for the performance measure program; Section 04.02 lists the PSOPMP performance measures; and Section 04.03 describes the on-going evaluation and review activities.

04.01 Purpose of Performance Measures

Performance measures, which compare actual performance against an established performance standard, benchmark, target, or level of service (LOS), help identify the relative health of specific operational areas. Performance measures include a subset of measures termed key performance indicators (KPIs). KPIs measure the relative health of the pump station system by comparison of actual system performance to system LOS targets. System managers will use performance measures to justify, allocate, and/or reallocate resources to underperforming areas; plan and develop budgets for additional resources; evaluate and document the effectiveness of different practices and procedures. In addition to efficiently conveying system and sub-system performance to wide audiences, system managers will use performance measures to make comparisons of systems across time and geography. MDWASD will implement use of a performance measure and KPI target system to evaluate pump station system O&M activity progress towards achieving the CD goal in accordance to the CMOM philosophy for continuous improvement.

04.02 Established Performance Measures

MDWASD has adopted a limited number of initial performance measures and KPIs to meet County and PSOPMP goals, and to ensure that MDWASD's successes are properly documented and reported. These measures and KPIs will aid MDWASD in assessing the overall effectiveness of the PSOPMP and will enable MDWASD to make adjustments in the program to achieve the established performance goals or targets to meet CD and LOS requirements. Table 04.1 presents the KPIs specified by the CD and MDWASD's target performance level for each which MDWASD will employ to measure, track, and report performance of the pump station system.

Table 04.1
Key PSOPMP Performance Indicators

Key Performance Indicator	Target
Annual number of pump station-related SSO events	9
Percentage of pumps in service	99%
SCADA network availability [1]	100%
Ratio of planned work orders to unplanned work orders	70%
Annual average time a budgeted position remains vacant	3 months
Annual average percentage of end of month vacant budget positions within PSD [2]	7%
Annual hours of PSD employee technical training	20

[1] MDWASD system-wide.

[2] The average of the 12 end of month values.

In developing the KPIs listed in Table 04.1, the PSD considered including an SSO response time measure. However, this performance measure was considered more applicable to the Sewer Overflow Response Plan (SORP) program. The first responders to a potential spill event are the WCTLD crews. The PSD is only notified of a potential spill event once the first responders have verified the spill event and performed a cursory cause analysis to determine that the spill is related to problems associated with the pump stations.

For pump station problems that do not result in a spill, the PSD is typically made aware of such problems through SCADA alarms and PSD or other MDWASD personnel visiting the station. Under current business processes, the work order tracking system in EAMS cannot easily track response times for such events because each activity and each trade requires a separate work order to be generated.

04.03 Performance Metric Reviews and Revisions

Since one purpose of the PSOPMP is to achieve continuous improvement, the PSD's management team will periodically evaluate each performance measure and may revise or change performance measures based on relevancy and value to the successful implementation and management of the PSOPMP. The PSD will review KPI actual performance versus target measures on a monthly basis to track performance versus progress toward the goal. The

monthly report reviews will be designed to identify areas where additional resources or attention is required to meet the annual target.

A semi-annual review will be conducted to determine if more wide-spread program-level modifications may be needed to meet overall system goals.

On an annual basis, the overall performance will be assessed and appropriate corrective measures identified and implemented to improve performance. The PSD's management team annual review will assess trends and needs for adjustments to preventative maintenance schedules and staffing and funding levels. These annual reviews may also drive modification of other CMOM Program element changes or revisions.

The PSD management review team responsible for periodic performance measure reviews will include:

- The PSD Division Chief,
- The PSD Assistant Superintendents, and
- The Trade Supervisors from each Maintenance Service Area.

For semi-annual reviews, the Assistant Director Wastewater is included. For Annual reviews, both the Assistant Director Wastewater and the Deputy Director of Operations are included.

THIS PAGE LEFT INTENTIONALLY BLANK

05. Pump Station Maintenance

Section 5 briefly outlines PSD's routine maintenance activities. The subsections are organized to generally follow the contents of Section 19(f)(i) through 19(f)(iii) as follows:

- Section 05.01, Means and Modes of Communication, addresses CD Section 19(f)(i).
- Section 05.02, Pump Station Technical Specifications, addresses CD Section 19(f)(ii).
- Section 05.03, Updating Pump Station Specifications, addresses the continuous improvement procedures that will be required under the PSOPMP's phased implementation plan to fully address CD Section 19(f)(ii).
- Section 05.04, Pump Station Monitoring Systems, addresses CD Section 19(f)(iii).

05.01 Means and Modes of Communication

The MDWASD wastewater collection system has one permanently manned pump station, Master Pump Station 0001. Master Pump Station 0002 has been automated and is no longer manned 24 hours per day. Operation and maintenance of Master Pump Stations 0001 and 0002 falls under the Wastewater Treatment and Maintenance Division. Regional/Booster Pump Stations 187, 300, 307, 536, 559, and 1310 are manned depending on system requirements. As part of the implementation phase of the PSOPMP, an independent analysis of the proper communication technology to be used in the future will be completed.

05.01.1 Personnel Communications

The primary means of communication between field crews and management personnel are direct telephone lines, cellular phones (i.e., personal cell phones), and radio. PSD utilizes three radio groups to facilitate communications. Radio communications are typically routed through the Communications Center, which is located at the Douglas Road main office. Currently, radio communication is the preferred method of communication because of the ability to go back and review recorded messages and track information about the transmission. Since the radio system has been taken over by the Police Department, the ability to review historical information has been cumbersome and inefficient. If the Communications Center has the recording, the

historical information can be provided, but there are times when the Police Department either are unable to provide the information or getting the information is not timely.

Work order communications rely heavily on the Enterprise Asset Management System (EAMS). The PSD Planners/Schedulers generate EAMS work orders for routine and preventative maintenance at frequencies described in later sections of this PSOPMP. EAMS also tracks unplanned, corrective, and emergency work orders that are generated by supervisors or the Communications Center. PSD maintenance staff generate work orders that are reviewed and assigned by supervisors to the appropriate resources. As the PSD implements the planned predictive maintenance activities under the CD, the EAMS work order system will be enhanced and extended to predictive maintenance activities.

Routine and preventative maintenance activities for PSD are documented by hand-written standardized forms, which are then scanned and attached to the correlating EAMS work order for closure. For the SCADA Section, routine and preventative maintenance activities are documented using digital hand held devices that allow the crew to pull up and check off a list of maintenance items. Upon completion of the checklist items, the EAMS work order is closed.

05.01.2 Equipment Communications

A Supervisory Control and Data Acquisition (SCADA) system is used to facilitate communication of equipment alarms and operating conditions. The system allows remote monitoring, data capture, and control of pumps stations.

The SCADA system monitors, transmits, and records data on various pump station parameters as listed at the end of this subsection. All MDWASD owned and operated wastewater pump stations, have SCADA installed. All new donated stations have SCADA installed within 6 months after MDWASD becomes operationally responsible, as required by the Consent Decree.

The Communications Center has access to remotely control all pump stations via SCADA; however, since they are not part of the PSD and lack operational knowledge, they are prohibited from doing so unless given specific instructions by a PSD Supervisor. During implementation, the PSD plans to move forward with activating the staffing plan, as defined in Section 09,

Staffing and Funding Plan, to assume the operational monitoring of the pump stations by creating positions for trained SCADA operators and expanding to multiple shifts. These staffing changes will enable the PSD to make informed decisions about the system and improve reaction time to alarms in the system.

The SCADA system monitors the following parameters:

- Elapsed run times per pump,
- Total run times by unit,
- Number of starts,
- Discharge pressure,
- Wet well level,
- Pump indication,
- Calculated flow,
- Rainfall gage data, and
- Generator indication.

SCADA alarm points include:

- Control unit (RTU) battery,
- Power (AC) failure,
- High level,
- Low level,
- Station flooding,
- Intrusion,
- High pressure (suction & discharge),
- Pump failure, and
- Other abnormal condition(s) depending on the facility.

05.02 Pump Station Technical Specifications

The PSD system has several types of pump stations as defined below. Stations are organized into one of four maintenance service areas: North, Central West, Central East, and South.

Master Stations. A Master Station is a type A wet well / dry well pump station with a building housing five or more large pumps (greater than 25 BHP each). Master Stations pump into large force mains that feed directly to a treatment plant. Currently, MDWASD has two master stations which pump directly into the Central District WWTP: Master Pump Station 0001 and Master Pump Station 0002. Design is currently underway for the addition of a sixth pump at Master Pump Station 0002. As previously indicated, the master pump stations are considered influent pump stations and are operated and maintained by the WWTPs. The master pump stations will be addressed in the WWTP Operations and Maintenance Program.

Table 05.1
Master Pump Station Listing

Number	Code	District	Station Name	Station Address	Atlas Pg.
0001	A52M+	SACE	4th Street WW Station	390 N. River Dr. NW	F-14
0001A	A32M+	SACE	4th Street WW Station	390 N. River Dr. NW	F-14
0002	A5RM+	SACE	9th Street WW Station	925 Biscayne Blvd. NE	E-13

Regional Stations. A regional station is a type “A” wet well/dry well structures with buildings. The regional categorization definition is a combination of station function and geographic location. Regional stations typically receive flow from other lift stations. These stations are categorized as such because they were constructed to replace small package-type wastewater treatment facilities that were acquired by MDWASD from 1973 to the mid-1980s.

Table 05.2

1072	A32R+	SAS	Gateway Pump Station	35250 177th Ct. SW	Z-36

Booster Stations. Booster Stations are type “A” stations which house three or more large centrifugal pumps. Booster stations are designed to maintain constant pressures in the force main system on the suction side for effective and efficient operation of local pump stations. These station types discharge through large diameter force mains for transmission of flow to the treatment facility. Booster stations use variable frequency drives that are controlled by suction and discharge pressure, or 2-speed motors, and commonly are equipped with cone type flow control valves and standby engine-generators.

Wet Well / Dry Well Stations (With Buildings). Wet Well/Dry Well Stations (With Buildings) have a classification type of “A”. In these stations, the pumps are separated from the wastewater being pumped. This type of station allows maintenance personnel to perform hands-on inspection without removing it. These stations have two or more dry well pumps.

Wet Well / Dry Well Stations (Underground). Wet Well/Dry Well Stations (Underground) have a classification type of “B”. In these stations, the pumps are separated from the wastewater being pumped and are located below grade either in a structure made of steel or concrete.

Wet Well Station: Submersible Pumps. Submersible Pump Stations have a classification type of “C”. These stations have pumps that are designed to operate submerged in the wastewater being pumped. These stations have 2 or more pumps.

Wet Well Station: Submersible Pumps with Building. Submersible Pumps with Building have a classification type of "D". These stations are submersible pump stations that are located within a building.

Wet Well Station: Self-priming Pumps Above Ground. Self-priming Pumps Above Ground have a classification type of "E". These stations have self-priming pumps mounted above ground (or partially above ground). They are typically fenced in for security, but have no buildings or enclosures.

Miscellaneous Stations: Stations that do not fall within the above listed station classes including pneumatic ejector dry well stations, air compressor stations, and vent stations have a classification type of "F". This class is being phased out.

Appendix B, EAMS Pump Station Database, is an example of the PSD-maintained stations organized by classification.

05.03 Updating Pump Station Specifications

MDWASD has the ability to enter pump station asset data into the Infor EAM System (EAMS) database for ease of data retrieval and to have a common data source. The EAMS database can be used to track systems, assets, inventories, work orders, etc. EAMS manages data by packaging it into three different types of entities: systems, positions, and assets. A "system" is a compilation of features that function as one entity with a single function. System entities can contain other entities, including position entities and other system entities. "Position" entities are used as placeholders for "asset" entities, and define the specific tasks needed to achieve a system goal. EAMS is a hierarchical system with the system entities at the top level, and the assets at the bottom level. The hierarchy of entities within a system entity is known as the "structure" and it defines sub-systems, positions, and assets that are part of the parent system.

Assets can be moved within the system from position to position, or they can be moved to a storeroom as inventory items or to a garage for repair. A "position" entity will describe what type of assets that particular position should accept. The "asset" will describe a specific piece of equipment down to the serial number. Assets should be assigned only to a position that

matches its characteristics. Each asset, position, or system can potentially have a class associated with it. A class has custom fields associated with it, and each time the class is associated with an entity, EAMS will apply those custom fields to the item so that information can be captured by the end user. The assignment of an asset to a position has to be done manually.

Each entity in EAMS has a set of standard fields, and user-defined custom fields, that capture the engineer's requirement that is pertinent to that particular entity. This capability allows a pump station to be described at a high level as a "system" entity, and at a low level in the "position" entities where specific component-level details are described. For example, at the "system" level the pump station can have a field such as "number of pumps", voltage, emergency portable generator kilowatt requirement, and station design capacity, which is more representative of the overall system operation. At the pump "position" level, the pump class identifies characteristics such as the pump total capacity, net capacity, horsepower, revolutions per minute (RPM), impeller size, impeller outer diameter (OD), total dynamic head (TDH), flow, etc. At the "asset" level, a pump asset will contain the same parameters as the "position" and will also include other asset-specific fields such as serial number, manufacturer, year built, etc.

Pump stations are entered into the EAMS database as "system" entities, and these in turn are part of a maintenance service area "system" entity, which are ultimately part of the parent PSD "system" entity. The four maintenance service areas are described as Service Area North (SAN), Service Area Central East (SACE), Service Area Central West (SACW), and Service Area South (SAS). In EAMS pump station system entities are identified by their class field "PUMPST", and belong to the Equipment Owner field "830" which refers to the PSD. Appendix B, EAMS Pump Station Database, contains a figure depicting a typical pump station asset hierarchy within EAMS.

Currently, only a limited number of EAMS pump station data fields are populated. The PSOPMP implementation plan will include the proper development of EAMS to handle capturing pertinent data for pump station components and subsequent field data acquisition activities to verify the currently populated data and to acquire new data. During field data acquisition activities, the following EAMS data fields will be filled in as part of the requirement for a technical specification

for each of the MDWASD-owned pump stations. The following list identifies a sample of some of the parameters which will be collected. A more complete list will be developed with PSD during the process of implementation.

- Station number,
- Address,
- Atlas page,
- Station classification,
- Station capacity (gpd),
- Number of pumps,
- Station speed,
- Station type,
- Station horsepower,
- Station phase,
- Station voltage.

The following list identifies some of the detailed information that the current EAMS database is lacking:

- Equipment type/class,
- Manufacturer,
- Model number,
- Equipment type,
- Impeller size,
- Impeller unit measure,
- Impeller interior diameter (ID),
- Total dynamic head (feet),
- Pump capacity (gpm),

- Speed (rpm), and
- Motor (hp).

Screen shots of the EAMS pump station data currently populated is in Appendix B, EAMS Pump Station Database.

The EAMS data acquisition implementation will be completed in a three step process:

1. Properly analyze the viability of EAMS and then move forward with a full implementation of an asset management system that can efficiently capture and report detailed information about the PSD system. The implementation of EAMS will include bar coding of all assets within PSD's responsibility and a system that will address repairable spares.
2. Complete a total system inventory utilizing a mobile data acquisition tool (i.e. laptop, tablet, etc.) to populate the existing list of pump stations with detailed information necessary for PSD to operate and maintain their assets. If consultants or vendors are used for the data acquisition, PSD staff time will also be required to accompany the contractors to each station and assist in equipment access and operations.
3. Develop a protocol to update the database with replaced components due to maintenance or rehabilitation to include the addition of new pump stations to the system to ensure the database remains populated with accurate inventory information.

The EAMS data acquisition implementation process will be coordinated with the implementation of the PSIP, SSAMP, IMS, and GIS CMOM Programs. In general terms, the CD requires:

- The PSIP to develop corrective actions for pump stations not in compliance with NAPOT requirements;
- The SSAMP to perform a current condition assessment of sewer system components, including the pump station components;
- The IMS to establish management, operations, and maintenance reporting to evaluate O&M, customer service, track scheduled O&M, etc.
- The GIS to import new assets into the appropriate GIS layer within 90 days.

05.04 Pump Station Monitoring Systems

As noted in Section 05.01.2, MDWASD uses the SCADA system to remotely monitor and control all pump stations within the WCTS.

Primary pump station automatic level controls, including bubblers, and submersible pressure transducers used in conjunction with floats as backups, are used to measure the level of wastewater in a wet well and activate/deactivate pumps via auxiliary control equipment, which converts the measurement from the primary control into a signal for a pump to start, stop, or change speed. These secondary controls convert a sensing signal into a mechanical or electrical signal which in turn activates a low voltage motor relay to start or stop motors, or signals to change ranges on variable speed equipment. Starting and stopping pumps can be performed remotely through the SCADA system to control both the discharge and suction pressure of the booster pump stations, to adjust total dynamic head in the system, and to assist in redirecting flow when necessary.

One of the primary functions of the SCADA system is to transmit alarms of equipment malfunctions. Alarm notifications typical generate “unscheduled maintenance or emergency” work order responses. The system is also used as a Predictive Maintenance tool (i.e., as in the case of pump operating time trend analysis example cited in the below paragraph). The data received from SCADA can be queried to generate various reports which are used to analyze overall system operation and identify individual pump station anomalies and repeat failures.

SCADA historical data records are stored in two separate databases. PSD uses 3-minute data and one-hour data to proactively identify potential problems with a pump station. Special attention is paid to pump operating time increases or when pumps exhibit uneven run times.

The SCADA Section has recommended development of a SCADA master plan to address issues such as appropriate technology upgrades, data management, data analysis improvements, historical databases, etc. Implementation of the SCADA master plan will be coordinated with MDWASD’s existing Pump Station Remote Monitoring (PSRM) Program under CD Paragraph 18(b). There is a need to address interdependencies with new CMOM programs identified in CD Paragraph 19.

THIS PAGE LEFT INTENTIONALLY BLANK

06. Pump Station Emergency Maintenance

The PSD characterizes emergency maintenance operations as unplanned/unscheduled or corrective activities that require immediate action in order to protect and preserve public health and safety. Emergencies are typically caused by situations that hinder the operation of the pump stations by reducing or interrupting their ability to transport sewage. The majority of emergency maintenance operations involve minor localized problems which affect a small area and which are addressed by a limited number of service crews. During times of significant storm events or major blackouts, the PSD will institute the Overflow Prevention Plan (OPP), effectively mobilizing and placing into high alert the entire PSD. The OPP is essentially a plan for more "extreme" emergencies such as a hurricane or a wide-spread flooding event.

Pump stations are critical for the proper transport of sewage through the WCTS. A nonfunctional pump station will cause sewage to accumulate in the pump station's wet wells and will cause an upstream backup which will result in overflows. For this reason, pump stations are designed with a number of safety mechanisms such as redundant pumps and, in the case of major pump stations, backup electric power generators. All of the pump stations in the MDWASD system have an N-1 design, where N represents the number of pumps needed to effectively handle the permitted flow. Therefore, if one of the mechanical pump systems becomes non-functional, there is at least one on-site backup pump to takeover. Unlike the mechanical redundancy, not all pump stations have backup electric power generators; therefore, the stations without generators are at risk of complete shutdown if there is a power outage as portable generators will have to be transported from elsewhere.

It should be noted that most overflows are caused by problems encountered on the wastewater collection lines such as grease blockages and broken mainlines. These problems with the WCTS fall under the responsibility of the Wastewater Collection and Transmission Line Division (WCTLD). Nevertheless, the PSD coordinates emergency responses with the WCTLD where there is overlap or where both need to work together to resolve an emergency situation caused by pump station problems. This cooperative effort is especially common when responding to spill events where a pump station problem causes an overflow at an upstream manhole. In those cases where the pump station was determined to be the cause of the overflow, WCTLD is

responsible for the spill clean-up activities, while PSD is responsible for the final spill reporting coordination with the Communications Center.

06.01 Sewer Overflow Response Plan Overview

As part of the current Consent Decree requirements, MDWASD is developing a Sewer Overflow Response Plan (SORP). The SORP will detail the regulatory, public notification, and reporting requirements as required by the Consent Decree. This SORP will replace the existing program for identifying and reporting SSOs.

06.02 Problem Identification

Due to the sensitivity of the WCTS to problems at the pump stations, any problem that could potentially create an overflow is considered an emergency and PSD staff responds accordingly. As described below, PSD problems can be identified through numerous channels, including:

- SCADA alarms,
- MDWASD personnel, and
- Customer complaints or external agency personnel.

Situations that require emergency action on the part of the PSD are routed through the Communications Center. The Communications Center is a 24-hour manned operations center within the Security and Communications Division, which is responsible for receiving notifications of potential problems and communicating these problems to the appropriate MDWASD divisions. Problems can be reported to the Communications Center via telephone by members of the public, via telephone by other agencies such as from RER-DERM, or via telephone, radio, or the County's intranet by personnel from within MDWASD. The Communications Center also monitors MDWASD's SCADA system for critical alarms requiring immediate action.

06.03 Emergency Operation Equipment and Capabilities

Critical to the ability of the PSD to mitigate emergency conditions are its portable emergency equipment such as diesel generators and bypass pumps, both of which are trailer-mounted for ease of transportation. Currently, the PSD is adequately equipped to handle most emergency

situations and abnormal events such as blackouts and tropical storms that may cause localized flooding.

06.03.1 Backup Power

The PSD relies on two types of backup power: on-site generators for larger stations such as master, regional, and booster stations, and portable generators for smaller pump stations. Larger stations are critical to the operation of the system and are thus expected to remain operational during most emergency situations. The PSD uses diesel-powered on-site generators. These installations require other ancillary equipment such as a diesel bulk storage tank and day tank, diesel pumps, and proper ventilation equipment. Many of these activities are maintained by other MDWASD divisions as described below.

Generators are composed of a driver component (the diesel engine) and the driven component (the generator itself). The PSD maintains the driven components for both mobile and fixed generators. The Wastewater Treatment and Maintenance Division maintains the driver component for fixed generators, and the Fleet Maintenance Division maintains the driver components for mobile generators. Approximately 180 to 190 pump stations have fixed generators. All other stations have external generator capability for mobile emergency generators. The PSD currently has 43 mobile trailer-mounted generators, the majority of which are from the early 1990s or newer.

06.03.2 Portable Bypass Pumping

Portable bypass pumping equipment is utilized during catastrophic equipment failures, when a generator is not a feasible alternative, or when a station needs to be taken out of service for either upgrades or wet well maintenance. When in bypass, the influent to the wet well is pumped to the surface and delivered through a valve connection in the pump station discharge line. Valves within the station control vault would be closed to prevent backflow into the station. Given this configuration, the pump station should operate to its design capacity while necessary repairs are being made or until power is restored. Bypass pumps are driven by electric motor or diesel engines. The PSD maintains bypass pumping equipment. The PSD currently has 41 mobile trailer-mounted pumps, the majority of which are from the 1990s.

Figure 06.1 is a schematic showing a typical bypass pumping installation.

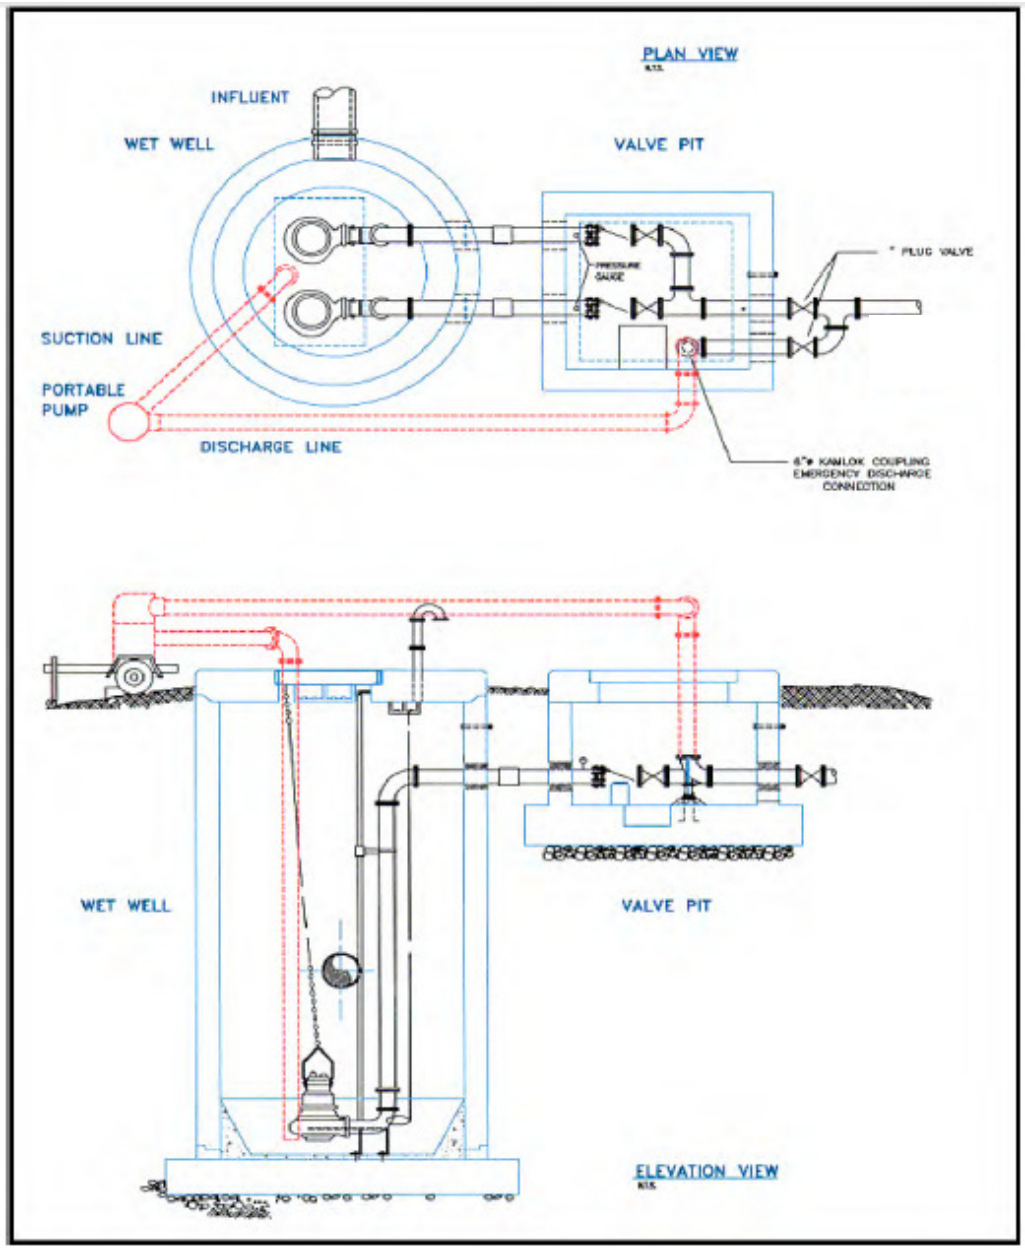

Figure 06.1
Wastewater Pump Station Bypass Schematic

06.04 Emergency Maintenance Procedures

The PSD responds to emergency conditions by performing emergency maintenance of pump station equipment. The majority of issues are “triaged” prior to dispatching crews by studying the conditions at the pump station by way of SCADA. However, the exact problem is typically

identified after the crews arrive onsite. Examples of pump station emergency maintenance can be categorized as:

- All pumps or motors are inoperable due to equipment failure (i.e. catastrophic failure);
- Lack of electrical power to the station;
- Failure of with instrumentation and/or controls; and
- Failure of SCADA RTU communication.

When one pump or motor becomes inoperable due to equipment failure, the operation of the pump station is not fully inhibited given the redundant pump design prevalent in all pump stations. Therefore, during these situations the repairs to the station can occur without the need to install a portable bypass pump since the remaining pump(s) can handle the full permitted flow. Catastrophic failures are instances in which a majority or all of the pumps or motors at a particular station suffer equipment failure leading to a significant or complete loss of pumping capacity and thus requiring the use of portable bypass pumps.

For stations that do not have onsite generators, a lack of electrical power to the station results in a complete shutdown of the station and therefore they are completely inhibited from operating. If the affected stations have an external generator connection, then portable generators are installed immediately to get the stations back online. Stations with no external generator connection require the use of bypass pumps during power loss situations. Failures of onsite backup generators are not common; however, if a backup generator does not come online during a power outage, the onsite electrical crew will attempt to address the problem. If the problem cannot be fixed right away, the responding electrical crew will install a mobile generator or request a bypass pump, depending on the availability of an external generator. In addition, the crews will notify the Communications Center that maintenance for the fixed generator is required by the Wastewater Treatment and Maintenance Division. The PSD crews will also inform Florida Power & Light (FP&L) of any power outages affecting the PSD's pump stations by contacting FP&L's hotline.

Problems in pump stations can also arise with instrumentation and SCADA RTU communication issues. When a problem arises due to instrumentation such as pressure transducers, level

controllers, or other, the Electrical trade addresses the issue. When a problem arises due to communication issues with the SCADA RTU, the SCADA Section technicians are currently responsible for addressing the issue. Since the main control of the pump stations is handled by a local station controller, a lack of communication to the SCADA RTU does not inhibit the operation of the station; however, wet well level and all statuses depending on SCADA transmission will not operate until the communication failure is resolved.

When any sort of equipment failure occurs, be it a pump, motor or instrumentation failure, the onsite crews will first assess whether the PSD has the capability to handle the repairs. It should be noted that the PSD is well-equipped to handle the majority of repairs and only in special circumstances where special parts are not kept in stock and/or the services to be provided are highly specialized does the PSD resort to requesting the services of outside Contractors / Vendors.

06.05 Post-Event Analysis

Upon full implementation of the PSOPMP, the PSD will conduct monthly reviews of emergency work resulting in an SSO event to identify “lessons learned” from the emergency situation. The goal of these monthly reviews is to ensure proper procedures and protocols were followed and to identify potential inadequacies associated with those procedures and protocols. The post event analyses will ensure lessons learned are applied to minimize the potential for future problems caused by similar conditions. The post event analyses will further ensure that if a “temporary fix” has been applied, steps to make a proper, permanent fix are identified for implementation. SOPs will be defined in the SORP document.

07. Pump Station Preventative and Predictive Maintenance

Preventative maintenance is the scheduled work performed to prevent equipment breakdown, reduce wear, improve efficiency, and extend the life of equipment. Scheduled routine maintenance includes the inspection, cleaning, and adjusting of equipment as necessary during routine pump station inspections and scheduled preventative maintenance.

MDWASD currently employs an EAMS software platform that serves to automate preventative maintenance schedules, generate and track work orders. Upon complete configuration, the EAMS system will enable the PSD to:

- Track inventory,
- Maintain a detailed pump station infrastructure database,
- Track equipment location that is dispatched and/or brought in for service,
- Query information on individual pump station equipment,
- Generate and track work orders for:
    - Scheduled Station inspections
    - Preventative Maintenance (PM)
    - Routine Maintenance (RM)
    - Unscheduled maintenance
    - Emergency maintenance
- Maintain equipment maintenance history,
- Generate reports, and
- Track maintenance cost and labor expenditures.

The PSD's preventative maintenance program has been developed based on the following factors:

- **Equipment manufacturers' recommendations.** Maintenance and overhaul recommendations are provided for each piece of equipment by the manufactures. In the implementation phase of this PSOPMP, it will be important to collect vendor literature

digitally and ensure it is stored in the EAMS associated with the respective equipment. The literature will define the frequency of oil changes and lubrication of bearings, types of lubricant, operating temperature ranges, pressures, flow rates, and disassembly procedures for specific equipment maintenance or parts replacement.

As a refinement to the existing preventative maintenance/routine maintenance methodology, once all equipment is inventoried and identified, a more accurate equipment maintenance schedule can be developed by listing all of the manufacturers' recommendations in sequence according to time periods. These schedules can be cross referenced with the current preventative and routine maintenance procedures and programmed in the EAMS to automatically generate work orders for PSD crews in accordance with revised scheduled requirements and availability of additional PSD staff to accommodate such revisions.

- **Individual station requirements.** Maintenance scheduling is dependent upon trade and station design. Due to the time required to travel in a congested urban area, PSD has scheduled preventative maintenance activities by station type, calendar and by geography. Preventative maintenance activities at pump stations in close geographic areas are scheduled at the same time so the maintenance crews can follow a defined route that is as efficient as possible. As a part of implementation, specific frequencies of schedules need to be adjusted to accommodate the needs and the geography of the individual station. These items will be developed primarily from station operating experience and will be re-evaluated annually by field crews, supervisors, and management or when the addition of donation pump stations require changes in the geographic grouping of the stations in that area.

- **Knowledge of the system and past performance.** Knowledge and experience regarding local condition and the reliability of the existing equipment are also considered in developing the maintenance schedules.

07.01 Preventative Maintenance Activities and Responsibilities

Preventative and/or routine maintenance is categorized into three trades by PSD; Mechanical, Electrical, and Structural.. The SCADA components at the pump stations have their own preventative maintenance/reactive maintenance schedules that are performed by the SCADA Section and are described in subsequent sections.

07.01.1 Staffing Resources and Capabilities

Appendix C, Routine and Preventative Maintenance Task Lists for the Trades, contains the specific task lists for:

- Mechanical Routine Maintenance,
- Electrical Routine Maintenance,
- Structural Routine Maintenance.

Preventative Maintenance is done for the Mechanical and Electrical components in accordance with the two detailed checklists provided in Appendix C. Upon implementation of the planned wet well capital unit, wet well inspections will be performed as part of routine maintenance inspections by all trades.

07.01.2 Service and Calibration

The equipment listed below is maintained as part of the routine and preventative maintenance tasks described above in accordance with the routine maintenance task lists included as Appendix C. The equipment is calibrated periodically by the PSD Electrical Maintenance Section, the Meter Installation and Maintenance Division, and the SCADA Section as part of MDWASD's scheduled maintenance. These groups are responsible for calibration of the following components to ensure data is transmitted to the SCADA system accurately. The following subsections describe the equipment in the system that is serviced and calibrated in accordance with their respective PM/RMs which are scheduled through EAMS.

Flow Meters. Flow meter maintenance is done by MDWASD's Meter Installation and Maintenance Division. Meter Installation and Maintenance maintains 37 flow meters associated with the WCTS. The wastewater meters fall into three specific categories based on purpose:

- Wholesale meters, which record flow from Volume Service Customers,
- Retail meters, which record flow from commercial or industrial customers, and
- Monitor meters, which record flow from regional pump stations and booster pump stations and from strategic points within the wastewater system.

For pump stations, there are 11 wholesale meters, 4 retail meters, and 22 monitor meters. These pump station monitor meters are critical in maintaining and operating the overall system flow direction and performance of the system. Meter maintenance is performed by the Meter Installation and Maintenance Section.

The Meter Installation and Maintenance Section is responsible for performing the following preventative maintenance activities on the meters in the wastewater system:

- Monthly: check condition of station, check 4-20 mA output and check calibration using flow simulator.
- Semiannual: conduct the monthly check plus perform a flow comparison (primary vs. secondary meters).

A complete meter inventory list which includes flow meter type, manufacture, size, and location sorted for pump stations only is included in Appendix D, Pump Station Meter Inventory.

Liquid Level Sensors. MDWASD currently uses two types of level controls, Bubbler System and Submersible Level Transducers. Float balls (float level switches) are used as backup level sensors for high level alarms and controls. Level sensors are part of the level control system that operate the pumps "On" and "Off". Additional components of the system include controllers and transmitters. The sensor can be cleaned and calibrated, but are typically replaced when they do not operate properly. Controllers and transmitters are also typically replaced when they fail.

Calibration of and between these units is performed during the Electrical Routine Maintenance Task List scheduled maintenance. The level sensors are checked for air leaks, pressure regulator set points, and alarm set points, as applicable to the sensor type. Crews ensure that pumps start and stop according to station's operating parameters and that level reading gauges are accurate and concur with SCADA readings. Notations of adjustments made to Level Controller are documented in the inspection forms and attached to the EAMS work order. As previously indicated, the Electrical Routine Maintenance Task List is included in Appendix C.

Bubbler System. Compressor bubbler systems are equipped with bubbler tube purge, tank moisture dump, system status indication, and system fault alarms. The unit provides a 4 to 20 mA analog output representing level for use by other devices to perform pump control or telemetry functions. The modular construction of this device allows for easy field servicing of the sub-assembly components.

Submersible Level Transducer. Submersible level transducers reliably measure the level of wastewater based upon the hydrostatic pressure of the liquid above the submerged sensor's diaphragm. The transducer provides an output signal directly proportional to the sensed level over the calibrated range of the sensing element.

Floats. Floats are normally used as back-up to the primary means of level controls as listed above. Typically, a series of floats are positioned at varying levels within the wet well to trigger alarm positions.

Alarm Sensors. SCADA equipment is calibrated or replaced on a SCADA maintenance scheduled. Alarm testing and is also covered by the Electrical Routine Maintenance Task List schedule. Alarms are checked, adjusted, or repaired as necessary to ensure proper functioning. The Electrical crew coordinates with SCADA and/or Communications Center to ensure that alarms are being received. External (local) visual alarms are also checked.

Elapsed Time Meters. Elapsed Time Meters (ETM) work in conjunction with the motor starters to record the run time duration of each pump. ETMs are inspected during both Electrical and

Mechanical Routine Maintenance Task List schedules. Readings are taken and compared to the transmitted SCADA data base. The ETMs are replaced as necessary.

Remote Sensing Equipment. Remote sensing equipment include a wide range of sensor options such as pressure switches, level sensor, pump run frequency and duration, pump motor current usage, sump pump activation, and alarms regarding lift station problems. The PSD Electrical trade preforms preventative maintenance, which test and record the electrical insulation level (meGOhms, amperage, and voltage of the above listed equipment.

07.01.3 Predictive Maintenance

Currently, the only predictive maintenance (PdM) being performed is routine review of ETM pump run time trends and transformers oil analysis.

The ETM installed on every pump is the best early warning sign of trouble at pump stations. In most properly operating pump stations, the pumps will be operating within a few percent of the run time to each other regardless of the number of pumps in the station. For the vast majority of single speed, automatic alternating pump stations in MDWASD's WCTS, this early warning system can help focus maintenance issues in an early, low manpower procedure. The accumulated data from the ETM readings, which is monitored for NAPOT compliance, is routinely tracked to determine if deterioration is occurring in any of the pumps in the system. The majority of pump clogging issues surround the wide variety of non-flushable materials now being discharged into the WCTS.

Under full implementation of the PSOPMP, additional predictive maintenance activities will be performed. The purpose of the additional PdM activities is to reduce unnecessary service to critical equipment which may otherwise be rebuilt or replaced simply due to fatigue. Typically, items that are identified as requiring the more proactive predictive maintenance take longer to service and are critical to pump station operation. These items are usually difficult to remove from service without affecting the operations of the facility. Instead of servicing this equipment on a routine schedule, various indicators are used to determine the need for the rebuild or replacement of equipment.

PdM is used for the early detection and prevention of equipment defects that could lead to unplanned downtime or costs. This is done when equipment is in operation to determine current equipment status and detect defects early. Through discussions with PSD, implementation will include the addition of four techniques: vibration analysis, thermal imaging, insulation resistance (i.e., the Megger Test), and oil analysis; all of which are used to find defects not typically discovered during routine or preventative maintenance inspections.

Vibration Analysis. One of the most revealing pieces of information regarding the condition of rotating machinery is a vibration signature. Vibration consists of amplitude, frequency, and direction. These provide the information needed to diagnose the machine's condition.

PSD maintains mostly centrifugal pumps that will generate pumping frequencies due to flow, cavitation, and recirculation (i.e., number of vanes multiplied by rpm for centrifugal pumps). Pumps also have other mechanical problems such as imbalance, misalignment, looseness, worn bearings, pipe strain, and resonance that cause vibration. Monitoring will include:

- Severity/amplitude,
- Frequency,
- Displacement,
- Velocity, and
- Acceleration.

Thermal Imaging. The objective of thermal imaging is to identify thermal variations, which may indicate:

- Hot bearings,
- Valve leaks,
- Plugged coolers, or
- Electrical faults.

As shown in the example thermal imaging scan in Figure 07.1, thermal imaging uses an infrared camera to measure equipment surface temperatures. Comparing thermal signatures with

duplicate equipment and establishing baseline thermal signatures for future trending will allow PSD to better predict when pump failure is imminent.

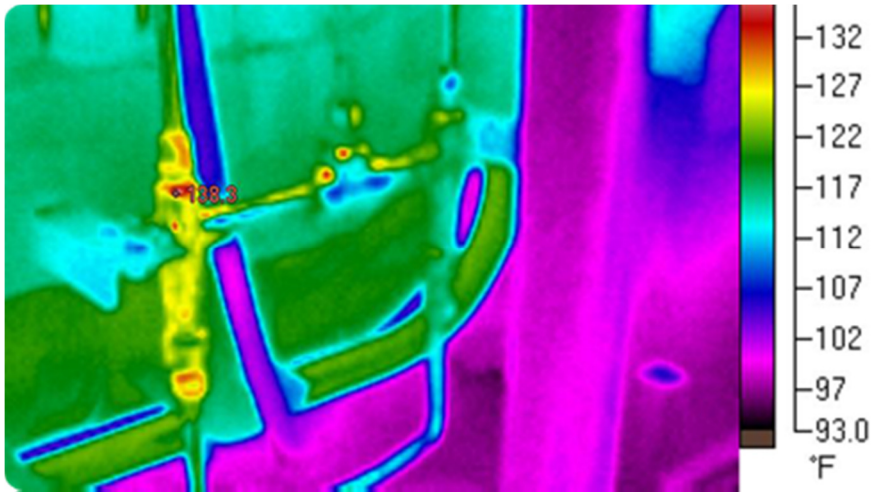

Figure 07.1
Example Thermal Imaging Predictive Maintenance

Items that will be included in the recommended implementation for target sensors are:

- Pump and motor
    - Bearing housings,
    - Seal flush systems,
    - Motor leads,
    - Couplings, and
    - Gear boxes.
- Ancillaries
    - Check/bypass valves,
    - Lube oil system, and
    - Heat exchanges.

Benefits of thermal imaging include:

- Identifying problems before they become serious.
- Improved reliability and uptime.

- Reduced unscheduled outages.
- Reduced maintenance costs.
- Baseline establishment for future trending.
- Quality assurance of new installations or repairs.

Insulation Resistance Testing (a.k.a., meggering the motor). The "Megger test" is a method of testing that makes use of an insulation resistance meter that will help to verify the condition of electrical insulation. This tests the integrity of the insulation of the motor windings, which break down gradually. Between half to three-quarters of motor failures in submersible pumps are caused by the insulation breaking down. With this testing method, users must choose between a manual test on a periodic basis or an automatic test. This form of testing is not new and has been in use for a number of years. One of the reasons that it is still such a popular option is because it is nondestructive. The test does have a limit of between 500 and 1,000 volts, so it may not always be able to detect some insulation punctures. It will usually show the amount of moisture, the leakage current, the moist or dirty areas of the insulation, and winding faults and deterioration. An example of a Megger test equipment kit is shown in Figure 07.2.

Figure 07.2
Example Megger Test Equipment

Oil Testing. Mechanical issues such as pump cavitation and vibration may be associated with poor lubrication. By checking the oil for viscosity, levels, temperature, contamination and type, pump problems may be prevented. Best practice activities to prevent oil-related failures include:

- Monitoring pumps and drivers closely to recognize subtle changes in oil levels, color, foaming, and cleanliness.
- Using infrared thermometers to check bearing and oil temperatures and inlet and outlet temps on oil coolers to determine efficiency.
- Frequently draining small amounts of oil from bearing housings to inspect for particle ingression, wear debris, and water content.
- Noting changes in vibration, unusual sounds, or oil leaks.
- Being vigilant in contamination-control practices. (It can cost 10 times as much to remove particle contamination from oil as it does to prevent contamination in the first place.)
- Learning the proper use of desiccant breathers, filter carts, and vacuum dehydrators.

07.02 Preventative and Predictive Maintenance Schedules

Figure 7.3 illustrates the PSD's process flow chart for issuing routine and preventative maintenance work orders.

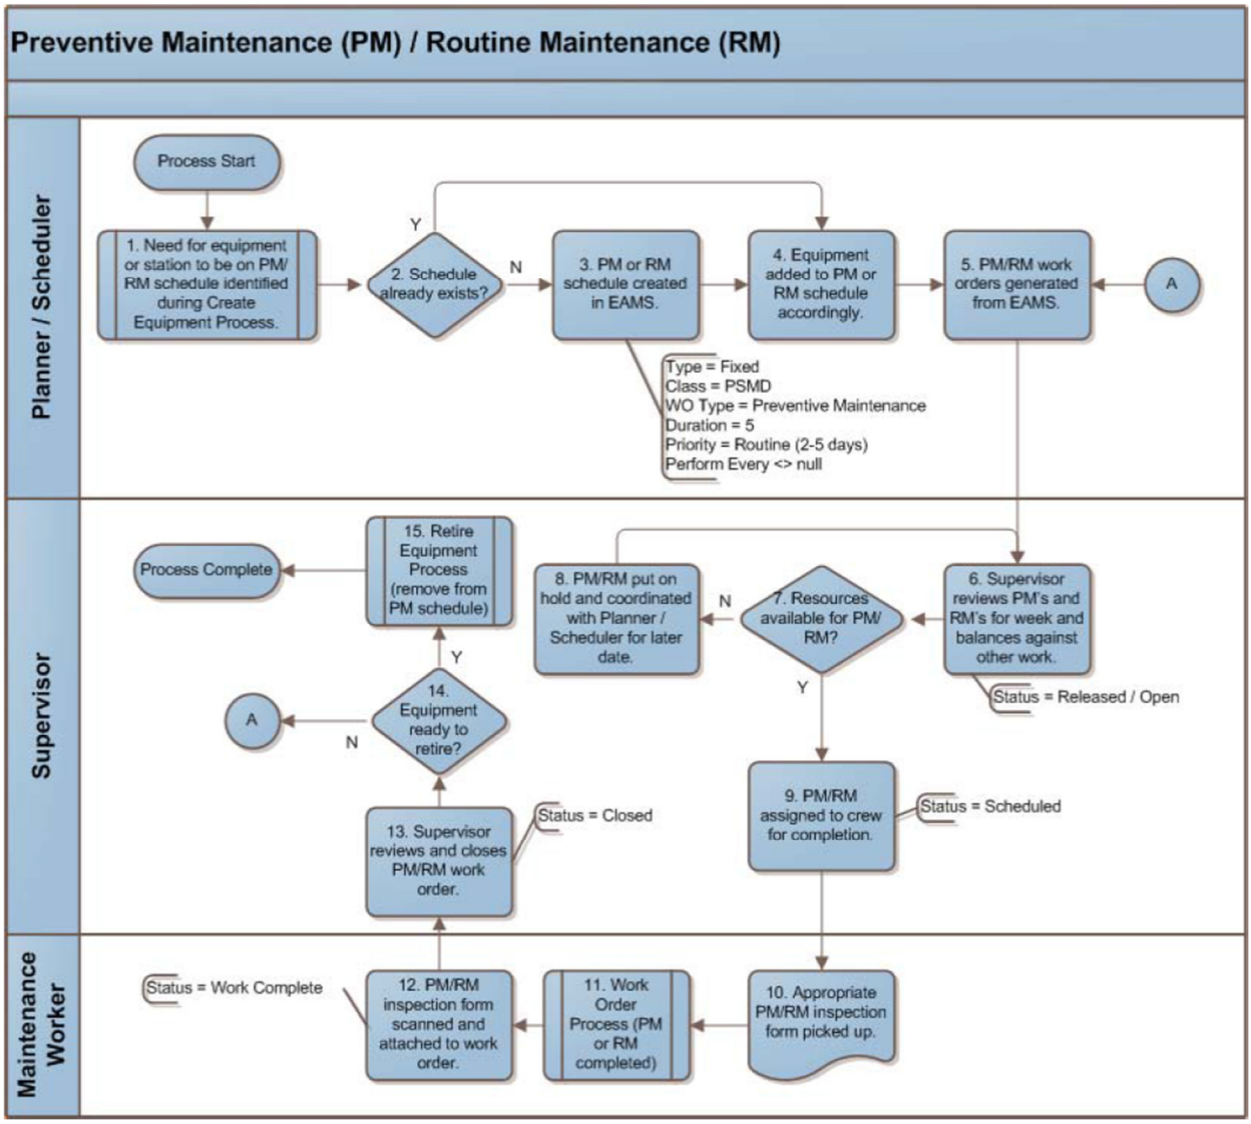

Figure 07.3
Preventative Maintenance (PM) / Routine Maintenance (RM) Flow Chart

07.02.1 Pump Station RM/PM Schedules

Mechanical, Electrical, and Structural routine and preventative maintenance schedules are automated through EAMS as developed by PSDs planner/schedulers. The work orders for the activity are generated automatically, and the PSD Supervisor assigns them to staff as appropriate. Routine and preventative maintenance activities are documented using the hard copy checklist described in Section 07.01, Preventative Maintenance Activities and

Responsibilities. Once the work is complete a scanned copy of the checklist is attached to the work order in EAMS and the work order is closed.

Routine maintenance is conducted:

- Every 28 days by all trades for booster, regional, and priority stations.
- Every 56 days by the Mechanical and Electrical trades for all stations.
- Every 84 days by the Structural trade for all stations

Preventative maintenance is conducted:

- Every year by all trades for booster, regional and proprietary stations (Proprietary stations are those operated and maintained by the PSD under maintenance contracts.)
- Every 2 years by the Mechanical and Electrical trades for all stations.
- As needed (As determined by the respective supervisor of a service area as a result of findings during routine maintenance. At any time the supervisor can request required scheduled maintenance based on field findings).

During the implementation phase of the program, PSD intends to increase efficiency of the work order process by modifying the business process and implementing a mobile solution within EAMS that will allow the field crews to create, access, utilize checklists, and populate routine and preventative maintenance documentation from a hand held device.

07.02.2 Monitoring Systems RM/PM Schedules

As with the pump station maintenance work orders, the SCADA Section maintenance work orders are processed through EAMS and are scheduled monthly for the regional and booster pump stations, as well as the rain gauges, and every two years for the remaining submersible and wet well/dry well pump stations. The work orders are generated by staff, and the supervisor assigns them to resources as appropriate. SCADA routine and preventative maintenance is managed on a digital hand held device that provides a checklist for the maintenance team to follow for calibration and taking down readings. It allows the crew to pull up and check off task

items as they are done. Since it is linked to EAMS, once the work is completed the work order is closed.

The SCADA Section performs preventative maintenance monthly or bi-annually, depending on staff-generated work orders in EAMS. See the SCADA preventative maintenance procedures provided in Appendix E, SCADA Maintenance Task List. The task lists in Appendix E were generated in EAMS. The following items are included:

- Utility Power Failure Alarm,
- Pump Failure Alarm,
- Pump Run Time Data Logging,
- Pump Duty Cycle Data Logging,
- Pump On/Off Status & Logging,
- Water Pressure & Flow,
- Wet Well Level with High/Low Alarm,
- Pump Warnings, Faults & Alarms Generator Status & Alarms, and
- Generator Status & Alarms.

The SCADA Section Preventative Maintenance Work Orders include Inspection Points. In EAMS, Inspection Points were created for each discrete task that the user would need to execute for each piece of equipment. Inspections Points are set up as either quantitative (requiring a numerical input), qualitative (requiring a text input either from a list of values or free text), or meter reading (numerical entry that is passed to a Meter in EAMS). The execution of Preventative Maintenance Work Orders in the field is further facilitated by the use of the Infor Advanced Mobile solution which, once a user synchs their work from the EAMS database to the device, provides disconnected access to the EAMS solution and store-and-forward technology that allows the device to synch up with the EAMS database when connectivity exists.

07.03 Monthly Work Order Status Reports

The PSD opens and closes work orders when the work is completed. Monthly EAMS reports are generated indicating the number of open work orders each month. To demonstrate the timeliness of the work order opening and closing processes an example listing of work orders within the EAMS system based on a monthly filter is included in Appendix F, Work Order Status Report EAMS Screen Shot Examples.

08. Inventory Management System

MDWASD's inventory management system provides a record of resources including parts, equipment, and facilities to support the field operations and maintenance activities that are conducted by the PSD.

08.01 Spare Part Locations

Workshops for each of the PSD's four sections are located at the Westwood Lakes, 36th Street, and South Miami Heights Maintenance Yards, and at the North District WWTP. The Westwood Lakes facility is strategically located near the center of all the service areas and is the facility recommended to house the pump station's SCADA monitoring and control center. The Westwood Lakes facility was built exclusively for pump station operations, but MDWASD now uses the workshop for other divisions and groups.

Pump station spare parts are stored in facilities in various locations through the four service areas so the parts are accessible quickly by the maintenance crews without extensive urban driving. There are a total of eight MDWASD Inventory Storerooms.

- Medley Yard Storeroom (7301 NW 70th Street, Miami, FL 33166),
- Hialeah Storeroom (1100 West 2nd Avenue, Hialeah, FL 33010),
- Alexander Orr Storeroom (6800 SW 87thy Avenue, Miami, FL 33173),
- Westwood Lakes Storeroom (4801 SW 117th Avenue, Miami, FL 33175),
- Water Transmission and Distribution Storeroom (1001 NW 11th Street, Miami, FL 33136),
- Virginia Key (Central District WWTP) Storeroom (3900 Rickenbacker Causeway, Key Biscayne, FL 33190),
- Interama (North District WWTP) Storeroom (2575 NE 156th Street, Miami, FL 33160), and
- Blackpoint (South District WWTP) Storeroom (8950 SW 232nd Street, Miami, FL 33190).

08.02 Critical Parts and Equipment Locations

Parts requiring continuous and immediate availability to support emergency repairs are defined as critical parts. The equipment required to successfully perform emergency repairs is defined as critical equipment. Examples of critical equipment include: pumps for bypass, hoses, generators, portable lights; small tools required to install critical parts; pump station system Asset Maps; etc. A list of spare parts and equipment indicated as “insurance items” is provided in Appendix G, Critical Spare Parts and Equipment List.

08.03 Inventory Management

Purchasing is centralized for stock items and decentralized for divisional purchases. An informal procurement process exists for equipment and repair services equaling $500,000 or less using multiple source quotations. For items above this amount, the solicitation has to be routed to the County Department of Procurement Management. Procurement Management reviews the solicitation process and the approval goes before the Board of County Commissioners. Emergency purchase orders can also be issued to override the normal, lengthy process when a documented emergency arises.

MDWASD’s Stores and Procurement Division uses EAMS to inventory and track stored parts for pump stations and to track location as well as inventory of specific items. The Stores and Procurement Division staff handle stock, storeroom management, and procurement of outside contracts for spare parts, materials, and services. The Stores and Procurement Division tracks inventory through the use of Division and Inventory Stores. Division (“D”) Stores were created for local tracking within a department. Tracking is determined by division and trade. Inventory (“I”) Stores manage inventory across departments and are not owned by any one department. EAMS allows for the tracking of stored parts for pump stations and track location as well as inventory of specific items. Items in the Stores and Procurement Division’s system identified as “Insurance Items” are parts and equipment that must be maintained at or above the minimum levels either due to availability or importance.

Primary spare parts inventories are maintained in the Stores and Procurement Division store rooms. As a best practice, MDWASD maintains local annual contracts to supply larger quantities of pump station-related parts and equipment.

Upon full implementation of program recommendations, spare parts will be checked out of the inventory using a bar coding system and the EAMS system tracks the transaction, the quantity in stock, and the location of the parts. Currently, the Stores and Procurement Division adjusts buying and stocking of inventory based on historical use tracked in the EAMS system. Restocking decisions are made on a max/min system. Stores and Procurement manages a list of County contracts of multiple manufacturers necessary to supply “Insurance Items” and other spare parts that are necessary to manage the WCTS. MDWASD is the largest user of these contracts for their system operations and maintenance. These contracts have caps and if exceeded approval is required from the Board of County Commissioners.

Four of the warehouse locations have vehicle maintenance facilities to service vehicles and equipment. The four vehicle maintenance facilities are at Westwood Lakes, Water Transmission and Distribution (11th Street), Virginia Key (Central District WWTP), and Blackpoint (South District WWTP).

08.04 Procedures for Updating List

During implementation, procedures for maintenance of an accurate inventory through the EAMS asset inventory will assist in ensuring the availability of critical spare parts for the pump stations. Should an unexpected need arise for a particular spare part or piece of equipment arise, MDWASD has contracts with virtually every manufacturer currently being used to ensure timely delivery of the needed item. If a manufacturer is not on the contract, they are added proactively so parts can be ordered in a timely manner.

THIS PAGE LEFT INTENTIONALLY BLANK

09. Staffing and Funding Plan

Since the 1996 Consent Order, PSD has fluctuated in staff levels tremendously through reorganizations and budget reductions. As shown on Table 09.1, these cuts have occurred even as the number of pump stations has increased, assets have continued to age, and experienced personnel have retired. During the FY 2014-2015 there were 195 budgeted positions in the PSD. As of the date of writing this document, 8 budgeted positions are vacant. In FY 1995-1996 there had been a PSD staff of 317 people managing 908 pump stations. Nearly twenty years later, the number of pump stations has increased by 139 to 1,047, but budgeted staff levels have shrunk from 317 to 195.

Table 09.1
PSD Pump Stations Compared to Fiscal Year PSD Budgeted / Contracted Staff Positions

Fiscal Year	MDWASD Owned Stations	MDWASD Maintained Stations	Total Number of Stations	Total PSD Personnel [2]
95/96	894	14	908	317
96/97	902	14	916	313
97/98	917	14	931	259
98/99	925	14	939	259
99/00	930	14	944	228

[1] Totals exclude two influent pump stations are operated by the Wastewater Treatment and Maintenance Division.

[2] Totals include temporary contract staff.

09.01 Staff and Skills Needs

The PSD continues to face challenges in recruiting qualified staff and providing the necessary training. The result of deficient staffing includes reduced maintenance, longer intervals between routine and preventative maintenance schedules, reduced task list, increased overtime, and increased likelihood of failure. A comprehensive training program for several facets of the maintenance program is needed to educate staff and provide incentive for them to grow within the organization. It has become increasingly difficult to recruit quality people mainly due to the fact that managers have to adhere to hiring protocols and job descriptions which can result in un-skilled labor entering the organization. Appendix H, Pump Station Division Job List, contains a listing of current PSD budgeted positions organized by trade.

PSOPMP implementation will include a staff hiring plan and equipment recommendations to allow PSD to operate at a higher level. Currently, the PSD does not have dedicated night time or weekend (i.e., second shift) maintenance crews. There are only day crews in each trade, structural, mechanical, and electrical, that operate during a single day shift. These same crews are on call for the night and weekend shifts, and are summoned by the Communications Center whenever an alarm event and/or an emergency arise. Not having second shift crews severely limits the PSD's ability to address issues timely in the evenings and on weekends putting MSWASD at risk for overflow situations.

The following draft staff hiring plan is based on staffing to a 24/7 basis within PSD. The draft staffing plan is also based on existing asset levels. Growth of the number of pump stations within the WCTS will require further analysis to determine potential additional staffing needs. The implementation recommendation includes a budgetary number for training that also needs to be further studied to get a more accurate picture of the program.

Table 09.2 recommends additional PSD staff augmentation to address existing staffing shortfalls associated with emergency operations.

Table 09.2
Recommended Staffing Additions Within the PSD

Program and Position	Abbreviated Description	Personnel [1]
WET WELL CLEANING		
Maintenance Repairer	These positions will allow for the observing and documenting of wet well conditions, including grease and debris accumulation. The hires will be required to operate vactor trucks used in wet well cleaning and may be required to perform confined space entry.	8 (2 persons per service area)
Maintenance Mechanic	These positions are required to pull submersible pumps, inspect condition and clean equipment in the wet well and return stations back to normal operating conditions	8 (2 persons per service area 4 utility body trucks with hoist and hatch 4 field use laptops)
ENGINEERING		
Engineer 2	To adequately address the need for professional electrical and mechanical expertise for maintenance, capital improvements and operational requirements at all PSD pump stations.	2 [1] (1 car and 2 laptop)
PUMP STATION OPERATIONS		
W&S Secretary	This position will serve a secretarial role for the Central East Service Area and Operations Control.	2
Assistant W&S Superintendent	This position will supervise the additional personnel needed for the 2nd shift, including diesel equipment maintenance, wet well cleaning/rehabilitation, and the Operations Control / SCADA monitoring.	1 (1 car and 1 laptop)
O&M Supervisor	These positions are for a night shift supervisor with weekend coverage responsibility, and will provide supervisory oversight for field crews on newly established 2nd and 3rd shifts.	3 (3 compact trucks and 3 laptops with EAMS access)
Plant Electrician	These positions are to provide the necessary level of staffing to increase pump station routine, preventative, and predictive maintenance that will bring staffing levels up to FY 1996/1997 levels.	9 (4 utility body trucks and 9 laptops)
Plant Electrician	These positions are to support the Electrical trade on the night shift, will provide 8 crews to perform electrical maintenance on pump station appurtenances, and will provide night coverage for newly established 2nd shift and weekend coverage. An additional 2 crews will be provided for the 3rd shift to allow for 24 hour, 7-day coverage.	24 (2nd shift – 4 per service area 12 utility body trucks and 12 laptops)
Plant Mechanic	These positions are to support the Mechanical trade on the night shift, and will provide 8 crews to improve response time to failures, thereby reducing the risk of spillage and protecting the public's health and welfare specifically at nights and on weekends. An additional	24 (2nd shift - 4 per service area 12 utility body trucks

Table 09.2
Recommended Staffing Additions Within the PSD

Program and Position	Abbreviated Description	Personnel [1]
	2 crews will be provided for the 3rd shift to allow for 24-hour, 7-day coverage.	with hoist and hitch)
Maintenance Mechanic	These positions are to provide the necessary level of staffing to increase pump station routine, preventative and predictive maintenance that will bring staffing levels up to FY 1996/1997 levels.	6 (3 utility body trucks and 6 laptops)
Maintenance Repairer	These positions are to provide the necessary level of staffing to increase pump station routine, preventative and predictive maintenance that will bring staffing levels up to FY 1996/1997 levels.	33 (22 utility body trucks)
SCADA AND INSTRUMENTATION SECTION		
O&M Supervisors	These positions are to manage the Operations Control / SCADA Monitoring that is not currently being performed by trained operators, but only monitored by untrained personnel in the Communications Center. These positions will cover a 2nd and 3rd shift that will allow for 24 hour, 7 day coverage.	6 (6 compact trucks and 6 laptops with EAMS access)
SCADA System Operators	These positions are to provide support to the Operations Control / SCADA Monitoring Shift Supervisor. These positions will cover a 2nd and 3rd shift that will allow for 24 hour, 7 day coverage.	6 (6 desktop computers with MS Suite)
Instrumentation Technician Supervisor	This position will provide a maintenance supervisor to manage the 8 Instrumentation Technicians who will maintain instrumentation and control appurtenances that provide signals to the SCADA system.	1
Instrumentation Technicians	These individuals will maintain pump station instrumentation and control equipment.	8 (4 light cargo vans and 4 field laptops with EAMS access)
DIESEL SECTION		
Plant Diesel Mechanic	These positions will provide 4 diesel mechanic crews to maintain the fixed diesel generators used as emergency backup power to over 70 wastewater pumping facilities.	8 (4 17,500 GVW trucks with utility body and 4 laptops)
EAMS Section		
Maintenance Planner Scheduler	These positions will establish and provide oversight and development of EAMS maintenance scheduling for routine, preventative, and predictive maintenance.	2 (1 per service area 2 desktop computers with EAMS access and MS Suite)
Asset Operation Technician	This position will provide data QA/QC including assistance overseeing the EAMS software for PSD, and the responsibility for management and	1 (1 desktop computer with EAMS access

Table 09.2
Recommended Staffing Additions Within the PSD

Program and Position	Abbreviated Description	Personnel [1]
	maintaining an accurate database of assets in the EAMS system.	and MS Suite)
SUBMERSIBLE REPAIR SHOP		
O&M Supervisor	The position will have supervisory oversight of the maintenance staff and management at two submersible pump repair shops. A new facility will need to be established for one of the proposed pump repair shops.	1 (1½ ton truck and 1 desktop computer with MS Suite)
Plant Mechanic	The position will provide two qualified mechanics to perform repairs to submersible pumps.	2 (1 desktop computer with EAMS access)
Maintenance Repairer	The position will provide adequate support and assistance to pump mechanics to perform repairs to submersible pumps.	3
MECHANICAL CAPITAL IMPROVEMENT		
O&M Supervisor	The position provides a mechanical supervisor that will provide oversight to maintenance staff and manage capital improvements to mechanical equipment.	1 (1½ ton truck and 1 desktop computer with MS Suite and 1 field laptop with EAMS access)
Plant Mechanic	The position will perform mechanical capital projects. Currently, this work is being performed by maintenance staff. Preventative maintenance work is being deferred, which is creating extensive backlog and putting pump station assets at risk for failure.	2 (1 17,500 GVW truck with utility body and 1 field laptop with EAMS access)
Maintenance Repairer	These positions will provide assistance to the Plant Mechanics performing mechanical capital work.	3
MECHANICAL PREVENTATIVE MAINTENANCE CREW		
Plant Mechanic	These positions will make up two crews that perform mechanical preventative maintenance at regional pump stations. Due to the size and amount of equipment at these stations, preventative maintenance takes 3 to 5 days to complete. This leads to preventative and corrective maintenance being deferred, which is creating backlog that increases the risk of failure of these critical pump station assets.	2 (2 17,500 GVW truck with utility body and 2 field laptop with EAMS access)
Maintenance Repairers	These positions will provide assistance to the Plant Mechanic performing mechanical preventative maintenance work.	2
STRUCTURAL MAINTENANCE SECTION		
Structural	Add two structural maintenance personnel.	2

Table 09.2
Recommended Staffing Additions Within the PSD

Program and Position	Abbreviated Description	Personnel [1]
Maintenance Worker		
	Proposed Additional PSD Staff	**170**

[1] The personnel column only includes MDWASD staff and associated equipment needs. The PS Technical Specification inventory and condition assessment activity is expected to require additional consultant or vendor resources.

In addition to the above implementation activities that require additional staff, there are several implementation activities that can be accomplished with existing PSD staff presuming the additional staff are available to free existing resources. These activities are included in Table 03.1 and include predictive maintenance (i.e., vibration analysis, thermal imaging, insulation resistance, and oil analysis); data management and integration analysis with IMS and SSAMS Programs; and communications analyses.

09.02 Training

The State of Florida does not require collection system operator certification. However, the Florida Water Pollution Control Operators Association (FWPCOA) does offer voluntary certification for both treatment plant and collection system operators. The PSD is promoting the requirement for all field and supervisory personnel to obtain a FWPCOA Wastewater Collection Technician Certification. The PSD also employs a number of trades that require State-recognized certifications (e.g., electricians).

The PSD is planning to institute a training program for PSD personnel to promote a higher training level, including certifications for selected job positions. PSD believes that having more highly trained staff will lead to greater productivity and professional growth, including the following components:

- Meet minimum training requirements for operations and maintenance personnel so as to meet 100 percent compliance with FWPCOA training guidelines (i.e., 5 hours every two years to meet certification requirements).

- Meet minimum training requirements for WCTS health and safety issues (e.g., confined space entry, waterborne pathogens, gas monitoring, lockout/tagout, etc.).
- Encourage meeting higher training levels for operations and maintenance personnel to meet other state mandatory certification requirements (i.e., North Carolina with 6 hours every year).
- Recommend more rigorous training for all trades in addition to the FWPCOA requirements.
- Recommend specialized electrical controls, variable frequency drives, and power training for electrical personnel.
- Involve cross-training of maintenance personnel to allow mechanical, electrical, and structural trades to understand each other's scope of work and to better work together to achieve common goals.

09.03 Funding Needs

Based on the PSOPMP implementation activities (as listed in Table 03.2), the identified staff required (as listed in Table 09.2), estimated equipment needed, and the identified consultant or vendor resources required (as footnoted in Table 09.2), Table 09.3 details the anticipated funding needs under the phased implementation for additional staffing. The funding shown in Table 09.2 does not include the funding requirements to perform existing PSD functions. The baseline of existing funding needs to stay the same as in the FY 2014-2015 budget. The anticipated budget needs shown in Table 09.3 is based on average salary budget found in Appendix H, Pump Stations Division Job List. The anticipated budget need details are included in Appendix I, Anticipated Budget Needs.

Table 09.3
Anticipated PSOPMP Phased Implementation Funding Required

Item	Description	Budget
MDWASD Staff	Additional 170 staff positions as detailed in Table 09.2.	$12,060,000 [1]
Training	Training allots budget for current and future staff	$910,000
Equipment	Additional 81 vehicles and 67 computers as detailed in Table 09.2 (includes O&M and PdM)	$4,298,000
Consultant / Vendor	Consultant / Vendor scope to be determined for implementation items.	$6,497,500
	ESTIMATED TOTAL	**$23,765,500** [2]

[1] Requested employees based on average salary budgets, which includes a 34% fringe rate.

[2] Preliminary capital and operating budget estimates are based average salaries, estimated training budgets, typical equipment costs, and preliminary vendor estimates that may vary depending on growth factors and implementation schedule. See detailed breakdown in Appendix I.

Under the County's budgeting system, costs must be defined in November in order to be included in the next fiscal year, which would start the following October 1.

10. Climate Change Impacts

In May 2014, the Miami-Dade County Board of County Commissioners passed a Resolution requiring that all County infrastructure projects "shall consider" the potential impacts of sea level rise and storm surge during all project phases (including planning, design, and construction) to ensure that these projects will function properly for fifty years or the design life of the project, whichever is greater. The County has also requested consideration of other climate change implications for County infrastructure projects.

This section addresses climate change impacts for the pump stations operated and maintained by PSD.

10.01 Pump Station Vulnerability to Climate Change

As the evaluation progresses with more specific recommendations for the pump station requirements each of the required CMOM Program shall take into consideration the vulnerability of the facilities to climate change impacts, such as sea level rise, storm surge, wind, and flooding, and the necessary improvements that can be made in pump station O&M protocols. For example, elevated groundwater levels from sea level rise and changes to infiltration are likely to increase pump operating times due to the expected increase in extraneous water entering the sewer system. This, and other climate changes, such as prolonged storms, will have impacts to the recommendations for the monitoring system and response protocols, technical specifications, preventative O&M schedules, and equipment inventories.

As a signatory to the South Florida Regional Climate Change Compact (SFRCCC), Miami-Dade joined other south Florida counties to develop a coordinated strategy for dealing with impacts of climate change. This includes a unified planning estimate for sea level rise projections. In 2012, the SFRCCC released the report, *Analysis of the Vulnerability of Southeast Florida to Sea Level Rise*, which contained planning time horizons and potential changes to sea level. This report predicted up to 3 feet of sea level rise by 2075. This report built on the SFRCCC recommendations previously related in the 2011 report, *A Unified Sea Level Rise Project for Southeast Florida*, where recommendations from the U.S. Army Corps of Engineers (USACE) were reviewed for projections to 2030 and 2060.

The impact of climate change on the pump stations serving the Miami-Dade service area vary depending on the geographic location of the specific station. In general, the pump stations will be exposed to three broad categories of climate manifestations and their associated components. First is the storm tide made up of the tidal cycle and the storm surge. Second is the role of hurricanes in South Florida was examined with the associated precipitation and winds. Third is the sea level rise and the associated impact on percolation and drainage, as well as overall flooding, as the ground level rises along with the sea level.

Table 10.1 presents the Saffir-Simpson Hurricane Wind Scale showing the types of damage and the anticipated power impacts associated with various hurricane categories.

Table 10.1
Saffir-Simpson Hurricane Wind Scale

Category	Sustained Winds	Types of Damage Due to Hurricane Winds	Anticipated Power Impacts
1	74 to 95 mph	Very dangerous winds will produce some damage	Extensive damage to power lines and poles likely will result in power outages that could last a few to several days.
2	96 to 110 mph	Extremely dangerous winds will cause extensive damage	Near-total power loss is expected with outages that could last from several days to weeks.
3 (major)	111 to 129 mph	Devastating damage will occur	Electricity and water will be unavailable for several days to weeks after the storm passes.
4 (major)	130 to 156 mph	Catastrophic damage will occur	Power outages will last weeks to possibly months. Most of the area will be uninhabitable for weeks or months.
5 (major)	157 mph or higher	Catastrophic damage will occur	Power outages will last for weeks to possibly months. Most of the area will be uninhabitable for weeks or months.

Source: http://www.nhc.noaa.gov/aboutsshws.php.

The framework for developing a pump station plan focused primarily on two factors:

- Asset life versus planning horizon and

- Pertinent industry design guidance documents.

Asset Life Versus Planning Horizon. Asset improvements or new assets at the pump stations can be broadly categorized into three components: structural, electrical, and mechanical. As shown in Figure 10.1, each has a different service life that ought to be considered when making decisions for resiliency adaptations. Routine O&M also present an opportunity to introduce additional adaptations.

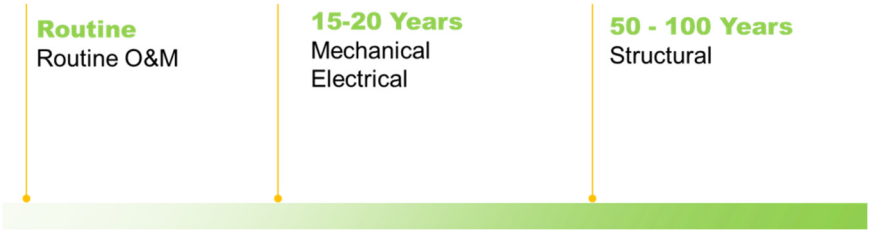

Figure 10.1
Pump Station Generic Service Life Schematic

The recommendation is that the climate resiliency feature be incorporated into the pump station upgrade and replacement design processes based on asset life. Specifically, the adaptation solution ought to coincide with the climate planning horizon that aligns with the asset life. For example, if the upgrade includes mechanical assets with a service life of 15 years, the corresponding time adaption feature would be determined during the basis of design report (BODR) process. Thus, the guidance takes the service life and the planning horizon as the framework; the specific action is to be determined during the BODR process when the project design is considered in totality. Table 10.2 outlines the guidance for planning horizons based on asset categories.

Table 10.2
Recommended Planning Horizon Based On Asset Life

Asset	Asset Life	Pump Station Replacement	Pump Station Rehabilitation
Structural	50 to 100 years	Target 2075	Comprehensive Structural Assessment in Basis of Design Report
Mechanical	15 years	2030	2030
Electrical and Controls	15 years	2030	2030

Pertinent Industry Design Guidance Documents. A pertinent guidance document is the American Society for Civil Engineers Standard (ASCE 24-05) Flood Resistant Design and Construction, which issues guidance for types of structures and lowest floor elevations. ASCE recommendations already incorporate storm surge estimates into their flood calculations. For the Category IV structures, which include public utilities, ASCE recommends that the Design Flood Elevation (DFE) is the 2 feet over the Base Flood Elevation (BFE).

Comments: _____

3. Inspect Alternator and control system for proper operation. Make adjustments as necessary. Correct deficiencies found.

Alternator:	OK	Repaired	Work Order Issued	#	Other
Control System:	OK	Repaired	Work Order Issued	#	Other

Comments: _____

4. Check operation of Level Controller. Check for air leaks, pressure regulator set points, alarm set points, etc. Ensure that pumps start and stop according to station's operating parameters and that level reading gauges are accurate and concur with SCADA readings. Make notations of adjustments made to Level Controller.
Post new Operating Level Settings Form.

Level Controller:	OK	Adjusted	Work Order Issued	#	Other

Comments: _____

5. Inspect wiring and connections in control panels, junction/ connection boxes, circuit breakers and terminal boards. Make corrections as necessary.

Control & Lighting Panels:	OK	Repaired	Work Order Issued	#	Other
Terminal Boards:	OK	Repaired	Work Order Issued	#	Other
Junction Boxes:	OK	Repaired	Work Order Issued	#	Other

Comments: _____

6. Inspect Service equipment. Note condition of equipment. Inspect Grounding system and check resistance. Max. 25 Ohms Check resistance of Fuses and compare readings. Different values may indicate weak fuses.

Service Equipment:	OK	Repaired	Work Order Issued	#	Other:
Service Grounding System:	OK	Repaired	Work Order Issued	#	Ohms:
A Phase Fuse	OK	Replaced	Work Order Issued	#	Ohms:
B Phase Fuse	OK	Replaced	Work Order Issued	#	Ohms:
C Phase Fuse	OK	Replaced	Work Order Issued	#	Ohms:

Comments: _____

7. Inspect Motor Starters. Replace worn out/pitted contacts as required. Inspect Overload block and Heater Elements for signs of heat stress. Repair/replace if necessary.

Motor # 1:	OK	Repaired	Work Order Issued	#	Other
Motor # 2:	OK	Repaired	Work Order Issued	#	Other
Motor # 3:	OK	Repaired	Work Order Issued	#	Other
Motor # 4:	OK	Repaired	Work Order Issued	#	Other
Motor # 5:	OK	Repaired	Work Order Issued	#	Other

Comments: _____

8. Check Circuit Breakers to ensure proper operation. Breakers found tripped must be investigated and fault condition cleared.

Light/Control Panel Circuit Breakers:	OK	Fault Found	Cleared Fault	Work Order Issued	#
Main and Motor Circuit Breakers:	OK	Fault Found	Cleared Fault	Work Order Issued	#
Generator Circuit Breakers:	OK	Fault Found	Cleared Fault	Work Order Issued	#

Comments: _____

9. Check interior/exterior illumination. Replace burnt light bulbs and/or repair lighting to ensure proper level of illumination.
Inspect lighting fixture connection box and check grounding.

Interior lighting:	N/A	OK	Repaired	Work Order Issued	#
Wall mounted exterior lighting:	N/A	OK	Repaired	Work Order Issued	#
Pole mounted perimeter lighting:	N/A	OK	Repaired	Work Order Issued	#

Comments: _____

10. Housekeeping. Check pump station interior and exterior for cleanliness and appearance. Clean as required and remove debris.

Interior:	N/A	OK	Cleaned	Work Order Issued	#
Exterior:	OK	Picked up debris	Cleaned	Work Order Issued	#
Sump Pump Pit:	N/A	OK	Cleaned	Work Order Issued	#

Comments: _____

11. Exercise Generator and auto transfer system. Inspect while under load to verify proper operation. Adjust as necessary. Record voltage, ampere and KW/KVA readings.

Generator:	OK	Adjusted	Work Order Issued	#	Other
Transfer equipment:	OK	Adjusted	Work Order Issued	#	Other
Voltage:					
Amperes 1:		**Amperes 2:**		**Amperes 3:**	
KW - KVA:					

Comments: _____

12. Inspect Battery Bank (s) and Charger (s). Clean and check battery connections. Test Specific Gravity of Cell's fluid.
Note number of Cells under 1200. Use N/A If not applicable.

	Voltage	Amperes	No. of Cells in Bank	Cells Under 1200
Generator Bank 1				
Generator Bank 2				
Switchgear Bank 1				
Switchgear Bank 2				
Charger 1			OK	Adjusted
Charger 2			OK	Adjusted

Comments: _____

13. Check Generator's Air Starting system. Drain Tank and observe air filling cycle. Note "cut on" and "cut off" pressures Use N/A if not applicable.

Air Starting System

Air Compressor 1	OK	Adjusted	Work Order Issued	**Tank Cut On Pressure:**	
Air Compressor 2	OK	Adjusted	Work Order Issued	**Tank Cut Off Pressure:**	
Air Compressor Aux.	OK	Adjusted	Work Order Issued	#	
Tank	OK	Adjusted	Work Order Issued	#	

Comments: _____

14. Check all Alarms. Adjust or repair as necessary to ensure proper functioning. Clean float switches. Coordinate with SCADA and/or Communications Center to ensure that alarms are being received. Check external (local) audio and visual alarms.

Door Switches:	OK	Repaired	Adjusted	Work Order Issued	#
Dry Well Flooding:	OK	Repaired	Adjusted	Work Order Issued	#
Low/High Level Electronic:	OK	Repaired	Adjusted	Work Order Issued	#
Common:	OK	Repaired	Adjusted	Work Order Issued	#
Low/High Level Float Switches:	OK	Repaired	Adjusted	Work Order Issued	#
Temperature Switches:	N/A	OK	Repaired	Work Order Issued	#
External (local) audio & visual Alarms:	OK	Repaired	Adjusted	Work Order Issued	#
Other(s):	OK	Repaired	Adjusted	Work Order Issued	#

Comments: _____

15. Inspect Sump Pump(s). Check for proper seating in pit and for leaky pipes and/or fittings. Clean sump pit.

Sump Pump(s):	N/A	OK	Repaired	Work Order Issued	#
Pipes & fittings:	N/A	OK	Repaired	Work Order Issued	#

Comments: _____

16. Check Hydropneumatic System. Drain tank and observe filling cycle. Note "Cut on" and Cut off" pressures. Use N/A if not applicable.

Hydropneumatic System

Tank:	OK	Repaired	Work Order Issued	**Tank Cut On Pressure:**	
Pump 1:	OK	Repaired	Work Order Issued	**Tank Cut Off Pressure:**	
Pump 2:	OK	Repaired	Work Order Issued	**Tank Water Level:**	
Air Compressor 1:	OK	Repaired	Work Order Issued	#	
Air Compressor 2:	OK	Repaired	Work Order Issued	#	
Controller:	OK	Repaired	Work Order Issued	#	

Comments: _____

17. Check Seal Water Systems. Drain and observe filling cycle. Note "Cut on" and Cut off" levels. Use N/A if not applicable.

Seal Water System

Tank:	OK	Repaired	Work Order Issued	**Tank Level:**	
Pump 1:	OK	Repaired	Work Order Issued	#	
Pump 2:	OK	Repaired	Work Order Issued	#	
Controller:	OK	Repaired	Work Order Issued	#	

Comments: _____

18. <u>WOUND ROTOR MOTORS ONLY</u>. Inspect brush holder assembly. Check for worn or defective brushes, replace if necessary Check and adjust spring tension. Check collector, clean and dress to maintain even surface. <u>CLEAN OR REPLACE AIR FILTERS TO ALL TYPES OF MOTORS WHEN APPLICABLE</u>. Use N/A if not applicable.

Motor # 1:	OK	Serviced	Replaced Brushes	Clean - Replace Air Filters	Work Order Issued
Motor # 2:	OK	Serviced	Replaced Brushes	Clean - Replace Air Filters	Work Order Issued

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

3. Check all pumps, motors, piping and related equipment for corrosion, numbering, as well as paint. Repair as needed.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

4. Inspect drywell structure for cracks, bubbling, peeling paint and spalling. Correct as needed.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

5. Inspect condition of roof and report any deficiencies to supervisor.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

6. Inspect windows and louvers for deficiencies. Lubricate operators and exercise. Replace/Repair as needed.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

R.M.

Miami-Dade Water and Sewer Department
Pump Station Maintenance Division
Routine Maintenance Task List For Pump Stations
Structural

WO#_____

7. Inspect deck gratings for missing hold down clips, loose supports or bent sections. Repair/Replace as needed.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

8. Inspect station ID sign for proper mounting and conditions. Check for visibility and replace as needed.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

9. Inspect station grounds for sod, asphalt, and unsafe conditions. Clean and remove debris as necessary.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

10. Inspect condition of fence and operation of gates. Repair as needed.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

11. Inspect station for any abnormal/unsafe mechanical or electrical conditions and issue work orders to appropriate supervisor. If deficiencies need immediate attention, supervisor should be notified by radio or pager.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

12. Inspect wet well condition. Check for evidence of corrosion, coating condition, superficial cracks and spalling. Check for and report deficiencies with operating equipment and grease build up.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

13. Check for and maintain proper house cleaning throughout pump station structure. Clean sump pits and verify proper operation of sump pumps.

☐ Ok ☐ Repaired ☐ Work order for deficiency found. ☐ N/A

Comments_____

Part	Description	Organization	Preferred Manufacturer	Category	OUM	Buyer	Preferred Supplier	Insurance Item	Repairable Spare	Calibration Standard	Prevene Reorders	Track by Asset
2520050024167	U-JOINT, FOR LEFT PUMP AT 4TH AND 9TH ST. STATIONS, F.M. 20 PUMP	WASD1	SPICER		EA			YES	NO	NO	NO	NO
2520050024168	CROSS, ASSY., W/CAP NEEDLE BEARING, LEFT PUMP AT 4TH AND 9TH STAT., F.M. 20	WASD1	SPICER		EA			YES	NO	NO	NO	NO
2815050013490	RING, ITEM 3, PUMP S/N 1543846, SIZE 20-LCS-4 VOLUTE, ENGINE S/N V03451, SW #5 M	WASD1	WORTHING		EA			YES	NO	NO	NO	NO
2815050033473	PUMP, LUBE OIL, ENGINE MODEL 12GT2B	WASD1	SUPERIOR		EA			YES	NO	NO	NO	NO
3010050014239	COUPLING, DRIVE HALF, FOR B.J. EFF PUMP 806E1073	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3010050014272	COUPLING, #401, WELL FIELD PUMPS	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3030050041265	BELT, V, POWER BAND, FOR MAG DRIVES CENTRATE PUMPS	WASD1	GATES		EA			YES	NO	NO	NO	NO
3110050008437	BEARING, RADIAL, P/N 1003201, WEMCO TORQUE PUMP 4X 4, ITEM #23	WASD1	NTN		EA			YES	NO	NO	NO	NO
3110050025541	BEARING, BALL, 35 X 72 X 27MM, DRIVE END, FOR CL-302 VACUUM PUMP(NASH UBB-0305)	WASD1	FAG		EA			YES	NO	NO	NO	NO
3110050029494	BEARING, BALL, INBOARD, FOR HIGH SERVICE PUMP, (ALLIS-CHALMERS CP811-005-733)	WASD1	SKF		EA			YES	NO	NO	NO	NO
3110050029495	BEARING, BALL, OUTBOARD, FOR HIGH SERVICE PUMP, (ALLIS-CHAL CP811-423-733),SET=2	WASD1	SKF		ST			YES	NO	NO	NO	NO
3110050032880	BEARING, RADIAL, MORRIS PUMP 2RX, S/N M-22155-57 (P/N 9001130300, MRC 313M)	WASD1	FAFNIR		EA			YES	NO	NO	NO	NO
3110050033350	BEARING, INBOARD, CHLORINE BOOSTER PUMP SPLIT CASE(ALLIS-CHALMERS 3-026-3)	WASD1	NTN		EA			YES	NO	NO	NO	NO
3110050034581	BEARING, INBOARD 6332, PUMP S/N 64869-1, SZ 36X24L(ALLIS-CHALMERS 52-129-364-001	WASD1	FAG		EA			YES	NO	NO	NO	NO
3110050035677	BEARING, OUTBOARD, CHEMICAL RECIRCULATION PUMP(DURCO 1K121)	WASD1	SKK		EA			YES	NO	NO	NO	NO
3110050039046	BEARING, MARINE, COLUMN PUMP	WASD1	THORDON		EA			YES	NO	NO	NO	NO
3110050041126	BEARING, LINE, HIGH SERVICE PUMP #5, MODEL 24LNC42, SERIAL # 0109MS001386	WASD1	FLOWSERV		EA			YES	NO	NO	NO	NO
3110050041127	BEARING, THRUST, HIGH SERVICE PUMP #5, MODEL 24LNC42, SERIAL # 0109MS001386	WASD1	FLOWSERV		EA			YES	NO	NO	NO	NO
3110050041134	BEARING, LINE, HIGH SERVICE PUMP # 3 & 4, SIZE 16LNC-28, SERIAL # 0109MS001385	WASD1	FLOWSERV		EA			YES	NO		NO	NO
3110050041135	BEARING, THRUST, HIGH SERVICE PUMP # 3 & 4, SIZE 16LNC-28, SERIAL # 0109MS001385	WASD1	FLOWSERV		EA			YES	NO	NO	NO	NO
3110050041198	BEARING, INNER, PUMP S/N K3W1070757-0, STA. 595	WASD1	FAIRBANK		EA			YES	NO	NO	NO	NO
3110050041199	BEARING, OUTER, PUMP S/N K3W1070757-0, STA. 595	WASD1	FAIRBANK		EA			YES	NO	NO	NO	NO
3110050041208	BEARING, BALL, PUMP S/N 1-64723-01-2, PS 690	WASD1	ALLIS-CH		EA			YES	NO	NO	NO	NO
3110050041209	BEARING, ROLL, PUMP S/N 1-64723-01-1, PS 690	WASD1	ALLIS-CH		EA			YES	NO	NO	NO	NO
3110050041644	BEARING, BALL, OUTBOARD, PUMP MODEL 7196, 4x4x12, S/N DP-759171, PS 0510	WASD1	CRANE DE		EA			YES	NO	NO	NO	NO
3110050041645	BERING, BALL, INBOARD, PUMP MODEL 7196, 4x4x12, S/N DP-759171, PS 0510	WASD1	CRANE DE		EA			YES	NO	NO	NO	NO
3120011557270	BUSHING, FOR PUMP MODEL 413, S/N 84-1207-1, L.H. ROTATION, SIZE 6X8X15	WASD1	AURORA		EA			YES	NO	NO	NO	NO
3120050013489	BUSHING, ITEM 3, PUMP S/N 1413987,88,89,90, SIZE 16-LNC-35 VOLUTE, SDR MAIN PUMP	WASD1	WORTHING		EA			YES	NO	NO	NO	NO
3120050014234	BEARING, BOTTOM, #104, FOR B.J. EFF. PUMP 806E1073	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050014235	BUSHING, THROTTLE, #232, FOR B.J. EFF. PUMP 806E1073	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050014317	BEARING, TEE, BYRON JACKSON PUMP S/N #279-740/45	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050025203	BEARING, PUMP MODELS 114, 115 & 116 FAFNIR SME15K/COL	WASD1	AURORA		EA			YES	NO	NO	NO	NO
3120050025249	BUSHING, FOR PUMP MODELS 114, 115 & 116 TYPE F4S	WASD1	AURORA		EA			YES	NO	NO	NO	NO
3120050030045	BEARING, TOP CASE, 3 1/2 X 4 X 2 7/16 , FOR PUMP MODEL 32RXL1, S/N 816-E-1103,	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050030051	BEARING, PLAIN, 3 1/2 X 2 7/16, PUMP MODEL32RXL1, S/N 816-E-1103, SWWF 25-28	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050030081	BEARING, BRONZE, TOP SERIES CASE, PUMP MODEL 32RXL, S/N 771E-0121/0126	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050031012	BEARING, INBOARD, PUMP S/N 251153, 14000 GPM	WASD1	TRANSAM-		EA			YES	NO	NO	NO	NO
3120050033224	BEARING, SCREW, PUMP MODEL 28TLO, S/N26142, WELLS1-4 (PATT. #A1610)	WASD1	U.S. PUM		EA			YES	NO	NO	NO	NO
3120050034432	BUSHING, THROTTLE, FOR PUMP SIZE 10 X 8 X 14 - U1314B	WASD1	ALLIS-CH		EA			YES	NO	NO	NO	NO
3120050039092	BEARING, BOTTOM, #104, PUMP MODEL 32RXL2STG, S/N 781E0173	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050040890	BEARING, CASE, BOTTOM, 32RXL1, 94-ER-1616, WEST WELL PUMPS 29, 30 ,31	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050040891	BEARING, JUMP, 32RXL1, 94-ER-1616, WEST WELL PUMPS 29, 30 ,31	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050040892	BEARING, CASE, TOP, 32RXL1, 94-ER-1616, WEST WELL PUMPS 29, 30 ,31	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050040893	BEARING, TENSION, 32RXL1, 94-ER-1616, WEST WELL PUMPS 29, 30 ,31	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3120050040895	BEARING, COLUMN, PLAIN, 32RXL1, 94-ER-1616, WEST WELL PUMPS 29, 30 ,31	WASD1	BYRON JA		EA			YES	NO	NO	NO	NO
3130050012309	BEARING, PILLOW BLOCK (MARLOW PUMP 2951200)	WASD1	LINK-BEL		EA			YES	NO	NO	NO	NO
4310050025520	SLINGER, FOR CL-302 VACUUM PUMP TEST NO. 83U-1688	WASD1	NASH		EA			YES	NO	NO	NO	NO
4310050025523	GLAND, LANTERN, FOR CL-302 VACUUM PUMP TEST NO. 83U-1688	WASD1	NASH		EA			YES	NO	NO	NO	NO
4310050033571	RING, SET, COMPLETE PUMP, AIR COMPRESSOR MODEL BRA20, S/N R70A5983 AND 5984	WASD1	CHAMPAIR		ST			YES	NO	NO	NO	NO
4320003535181	PLATE, WEAR, FOR PUMP MODEL 13A2-B	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO
4320003535188	WEIGHT, LARGE, FOR PUMP MODEL 14A2-B	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO
4320004078522	PLATE, WEAR, FOR PUMP MODEL 14A2-B, 14A11-B	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO
4320004278586	WEIGHT, SMALL, FOR PUMP MODEL 14A2-B	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO
4320004673065	SHAFT, FOR PUMP MODEL 413, S/N 84-12607-1, L.H. ROTATION, SIZE 6X8X15	WASD1	AURORA		EA			YES	NO	NO	NO	NO
4320004807397	RING, SLINGER, FOR PUMP MODEL 14A2-B	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO
4320004963679	PLATE, COVER, FOR PUMP MODELS T3A3-B, T4A3-B, T6A3-B, T8A3-B, 14A2-B	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO
4320007792837	LINER, SEAL, FOR PUMP MODEL 12D-13, S/N 756206	WASD1	GORMAN-R		EA			YES	NO	NO	NO	NO

6680050033393	INLET, ROTAMETER, FOR V-2000 CHLORINATOR	WASD1	WALLACE-		EA			YES	NO	NO	NO	NO
6680050033404	TUBE, ROTAMETER, FOR V-2000 CHLORINATOR	WASD1	WALLACE-		EA			YES	NO	NO	NO	NO
6680050033614	FLOWMETER, VISI-FLOAT, FOR PLANT S/W SYSTEMS	WASD1	DWYER		EA			YES	NO	NO	NO	NO
6680050036390	TURBIDIMETER, LOW RANGE PROCESS, MODEL 1720C, 973FILTER REUSE SYSTEM TO FIU	WASD1	HACH		EA			YES	NO	NO	NO	NO
6680050037734	TACHOMETER, PANEL	WASD1	SHIMPO		EA			YES	NO	NO	NO	NO
6680050041368	PROBE, 1 METER, 10 SENSORS, 4" BETWEEN SENSORS, W/60 FT CABLE, PS CONTROL PANELS	WASD1	MULTITRO		EA			YES	NO	NO	NO	NO
6685050015114	THERMOMETER, FOR AC MOTOR	WASD1	WEKSLER		EA			YES	NO	NO	NO	NO
6685050024544	THERMOMETER, STAINLESS STEM 30-240 RANGE (NO SUBSTITUTIONS)	WASD1	SYBRON/T		EA			YES	NO	NO	NO	NO
6685050029086	THERMOMETER, BI-THERM DIAL, 30-240 DEGREE F, 18 STEM, 9 IND. GLASS, W/FITTING	WASD1	SYBRON/T		EA			YES	NO	NO	NO	NO
6685050036127	TRANSMITTER, POTENTIOMETER, 4-20 MA, 24V DC (NO SUBSTITUTIONS)	WASD1	M-SYSTEM		EA			YES	NO	NO	NO	NO
7530050029572	CHART, RANGE 0-45, 7 DAY, FOR FLOWMETER M27, BOX OF 100 (NO SUBSTITUTIONS)	WASD1	BADGER M		BX			YES	NO	NO	NO	NO
7530050029573	CHART, RANGE 0-65, 7 DAY, FOR FLOWMETER M6, BOX OF 100 (NO SUBSTITUTIONS)	WASD1	BADGER M		BX			YES	NO	NO	NO	NO
7530050029574	CHART, RANGE 0-25, 7 DAY, FOR FLOWMETER M42, BOX OF 100 (NO SUBSTITUTIONS)	WASD1	BADGER M		BX			YES	NO	NO	NO	NO
7530050036327	CHART, 0-10, 24 HOUR, HKTW01005016, FLOWMETER (NOSUBSTITUTIONS)	WASD1	FISCHER		BX			YES	NO	NO	NO	NO
7530050036502	CHART, 0-100, FOR INJECTION WELL PUMP STATION METER (NO SUBSTITUTIONS)	WASD1	CHESSELL		BX			YES	NO	NO	NO	NO
7530050036504	CHART, STRIP, FOR INJECTION WELL PUMP STATION METER (NO SUBSTITUTIONS)	WASD1	FISCHER		BX			YES	NO	NO	NO	NO
4730050004793	PLUG, FOR CL2 ALARM & POSITIONER, FOR CHLORINATION SYSTEM	WASD1	WALLACE-		EA			YES	NO	NO	NO	NO
5360050025395	SPRING, DISC,#511, F/CLARIFIER DRIVE ASSY MECHANICAL OVERLOAD ALARM#DWG04D13885	WASD1	DORR-OLI		EA			YES	NO	NO	NO	NO
5365050025396	SPACER, #510, ON CLARIFIER DRIVE ASSY MECHANICAL OVERLOAD ALARM #DWG04D13885	WASD1	DORR-OLI		EA			YES	NO	NO	NO	NO
5365050025397	SPACER, #510, ON CLARIFIER DRIVE ASSY,MECHANICAL OVERLOAD ALARM # DWG04D13885	WASD1	DORR-OLI		EA			YES	NO	NO	NO	NO
5930050035300	SWITCH, ALARM, LOW TEMPERATURE	WASD1	WALLACE-		EA			YES	NO	NO	NO	NO

ANTICIPATED FUNDING NEEDS

THIS PAGE LEFT INTENTIONALLY BLANK

ANTICIPATED FUNDING NEEDS

SALARY:		
Requested Employee (170):	$	9,000,000.00
34% Overhead (fringe rate):	$	3,060,000.00
Total Loaded Salary:	**$**	**12,060,000.00**

TRAINING:		
Current Employees:	$	485,000.00
Avg. Training Cost:	$	2,500.00
# Employees:		194
Requested Employees:	$	425,000.00
Avg. Training Cost:	$	2,500.00
# Employees:		170
Total Requested Training:	**$**	**910,000.00**

EQUIPMENT:		
Operations and Maintenance Equipment:		
Requested Vehicles:	$	4,050,000.00
Avg. Cost:	$	50,000.00
Quantity:		81
Requested Computers:	$	134,000.00
Avg. Cost:	$	2,000.00
Quantity:		67
Predictive Maintenance Equipment:		
Thermal Imaging:	$	30,000.00
Unit Cost:	$	2,500.00
Quantity:		12
Oil Analysis:	$	18,000.00
Unit Cost:	$	1,500.00
Quantity:		12
Vibration Analysis:	$	24,000.00
Unit Cost:	$	2,000.00
Quantity:		12
Megger Test:	$	42,000.00
Unit Cost:	$	3,500.00
Quantity:		12
Total Requested Equipment:	**$**	**4,298,000.00**

VENDOR CONSULTANT:		
Pump Station Technical Specifications (Data Collection):	$	2,180,000.00
Pump Station Technical Specifications and Data Attribution (EAMS):	$	850,000.00
Critical Spare Parts (EAMS):	$	260,000.00
Maintenance Scheduling (EAMS):	$	2,110,000.00
Analyze Communications:	$	250,000.00
Project Management:	$	847,500.00
Total Vendor Consultant:	**$**	**6,497,500.00**

TOTAL ESTIMATED BUDGET INCREASE:		
Total:	**$**	**23,765,500.00**
